

UNITED STATES
NUCLEAR REGULATORY COMMISSION
WASHINGTON, D.C. 20555-0001

April 21, 2022

MEMORANDUM TO: Richard Chang, Chief
Licensing Projects Branch
Division of Operating Reactor Licensing
Office of Nuclear Reactor Regulation

FROM: Lois M. James, Senior Project Manager */RA/*
Licensing Projects Branch
Division of Operating Reactor Licensing
Office of Nuclear Reactor Regulation

SUBJECT: MEETING SUMMARY - MARCH 4, 2022, MEETING ON STAFF
PERSPECTIVES ON RISK-INFORMED MODIFICATION OF
INSERVICE INSPECTION PROGRAM

On March 4, 2022, the U.S. Nuclear Commission (NRC) staff met with representatives from the Electric Power Research Institute (EPRI) to discuss the staff's perspective on risk-informed modification of the inservice inspection program. The meeting summary is provided as Enclosure 1 and the list of attendees is provided as Enclosure 2. The meeting notice is dated February 22, 2022, and the meeting agenda is available in the Agencywide Documents and Access Management System at Accession No. ML22053A171. The NRC staff presentation slides are available in ADAMS at Accession No. ML22060A277.

If you have any questions or comments, please contact me via e-mail at Lois.James@nrc.gov.

U.S. Nuclear Regulatory Commission Public Meeting Summary

Title: Staff Perspectives on Risk-Informed Modification of the Inservice Inspection (ISI) Program

Date of Meeting: March 4, 2022, 1:00 pm – 2:30 pm

Location: Webinar

Type of Meeting: This was an Observation Meeting in which attendees had an opportunity to observe the U.S. Nuclear Regulatory Commission (NRC) performing its regulatory function or discussing regulatory issues. Attendees had an opportunity to ask questions of the NRC staff or make comments about the issues discussed following the business portion of the meeting; however, the NRC was not actively soliciting comments toward regulatory decisions at this meeting.

Purpose of the Meeting: To communicate the NRC staff perspectives on risk-informed modification of the ISI program.

General Details: The NRC staff held a public, observational meeting with the Electric Power Research Institute (EPRI) to communicate the staff perspectives on risk-informed modification of the ISI program. The meeting began at 1:00 pm and ended 2:30 pm. There were 26 NRC staff members, 4 EPRI representatives, 21 members of industry, and 22 members of the public or individuals who did not identify their affiliation. The meeting began with introductions of the NRC staff, EPRI representatives, and industry members.

Summary of Meeting: The NRC staff began the meeting by noting an increase in ISI submittals that are explicitly or implicitly risk informed. Further, the staff noted that many of these submittals contain novel applications of probabilistic modeling or other risk-based arguments. The staff is reviewing these risk-informed applications, whether explicit or implicit, on their merits under the risk-informed decisionmaking framework.

To ensure a common understanding, the staff described the principles of risk-informed decisionmaking:

1. current regulations must be met
2. defense in depth consistency
3. maintenance of safety margins
4. risk-informed analysis
5. performance monitoring

All five of the principles need to be addressed. The NRC staff provided an example in that probabilistic fracture mechanics (PFM) analyses may support Principle 3, maintenance of safety margin, and Principle 4, risk-informed analysis, but does not address Principle 5, performance monitoring. However, PFM analyses allow for more “weight” to be given to Principle 4, risk-informed analysis, when combined with adequate Principle 5, performance monitoring.

In discussing Principle 5, the NRC staff explained that performance monitoring provides:

1. Direct evidence of the presence and extent of degradation if present
2. Validation and confirmation of the adequacy of analyses
3. Timely methods to detect novel or unexpected degradation

Industry members expressed concern about the 20-year limit and why the NRC staff appears to be deviating from the pilot plant's amendments that have been approved.

Regarding the deviating from the pilot plant's amendments, the NRC staff explained that not all the subsequent applications submitted have been consistent with the pilot plant's application and these inconsistencies have resulted in internal conversations and reconsideration of the path forward. Specifically, the NRC staff acknowledges that it was not as clear as it should have been in the safety evaluations for the pilot plant's amendments and that it did not fully address the implications of the decisions as well as it should. When it comes to approving ISI extensions, the NRC staff stated that the three objectives that need to be met for performance monitoring are:

1. direct reading,
2. to validate basis analysis, and
3. it has to be timely.

The NRC staff further stated that performance monitoring does not have to be any specific testing. Rather the testing must be justified as supporting the three objectives listed above.

Regarding the 20-year extension limit, the NRC staff stated that any year is arbitrary. The length of the extension depends on many things, such as the safety significance of the component and the environment of the component. The NRC staff chose 20 years as a judicial, prudent, first step. A longer time can be requested but such a request must have a judicial, prudent, justification which should include an appropriate level of performance monitoring.

The NRC staff restated that two key aspects of performance monitoring are to make sure that basis analysis and calculations remains valid and to see if there are any new or unknown degradations.

Industry members asked if it would have been better to have submitted a topical report (TR). The NRC staff stated that a TR would have been better. When reviewing a TR, the staff is looking on a general level about what level of sampling is appropriate. The NRC staff has found several levels of sampling acceptable, and sampling is a powerful tool and justification. When reviewing plant specific ISI extensions, the sampling aspects are limited.

The NRC staff ended the meeting by reiterating the practical takeaways:

1. Extension of ISI intervals to 20 years may be justified as a prudent "first step" in optimization of ISI intervals
2. Coordination of inspections over extended ISI intervals is prudent to ensure appropriate monitoring and trending of the subject components
 - Monitor for potential unknown degradation mechanisms

- Form a basis for potential future applications to further extension

Public Participation Themes:

No member of the public spoke on the webinar and no public meeting feedback forms were received.
