733RD MEETING

ADVISORY COMMITTEE ON REACTOR SAFEGUARDS

(ACRS)

+ + + + +

THURSDAY

MARCH 5, 2026

+ + + + +

The Advisory Committee met at Two White Flint North, 11545 Rockville Pike, Rockville, Maryland, and via videoconference, at 8:30 a.m. EST, Gregory Halnon, Chair, presiding.

COMMITTEE MEMBERS:

GREGORY H. HALNON, Chair

DAVID A. PETTI, Vice Chair

CRAIG D. HARRINGTON

ANNIE M. KAMMERER

WALTER L. KIRCHNER

ROBERT P. MARTIN

SCOTT P. PALMTAG

(8:39 a.m.)

1
2
3 CHAIR HALNON: Yes, given that we have no
4 technical topics, I'm going to open the floor for any
5 public comments relevant to the ACRS or other issues
6 for just a few seconds. So is there any public
7 comments? Raise your hand on Teams and then state
8 your name. Okay. Seeing none, let's go ahead with
9 our first topic. Dave, do you want to read the letter
10 in?

11 VICE CHAIR PETTI: Yes. So I took -- I
12 got a lot of comments from people since our meeting
13 last month, largely just English, although there are
14 two new paragraphs at the end that are completely new.
15 When we get there, I'll note that. I thank everyone.
16 I just found out there were a couple that I didn't get
17 to your comments, so we'll have to --

18 Okay. Dear Chairman Nieh, during its
19 732nd and 733rd meeting from February 5th to February
20 6th, 2026 and March 5th to 7th, 2026, the Advisory
21 Committee on Reactor Safeguards reflected on lessons
22 learned from reviewing new reactor applications. The
23 Committee's discussions occurred against the backdrop
24 of three major themes: A, ensuring that ACRS continues
25 to meet its statutory responsibilities, B, advancing

1 the administration's goal of safe nuclear energy
2 deployment by collaborating with staff to ensure
3 reviews are timely, efficient, and attentive to unique
4 or significant issues, and C, supporting the NRC's
5 leadership and foremost reputation in nuclear safety.

6 The Committee's deliberations encompassed
7 the following recent reviews of applications, the
8 NuScale US600 DCA and US460 standard design approval,
9 the Kairos Hermes and Hermes 2 construction permits,
10 and the TerraPower Sodium construction permit at
11 Kemmerer, Wyoming, ongoing construction permit reviews
12 for X-energy's Xe-100 in Seadrift, Texas, and General
13 Electric's BWRX-300 at Clinch River, Tennessee, and
14 pre-application topical reports from other vendors.
15 Additionally, the Committee considered guidance from
16 the Accelerating Deployment of Versatile, Advanced
17 Nuclear for Clean Energy Act, ADVANCE Act. Executive
18 Order 14300 brought in the reform of the Nuclear
19 Regulatory Commission and other relevant Commission
20 direction.

21 Conclusions and a proposed path forward.
22 The ACRS has adopted a more efficient review approach
23 consistent with directions provided in the ADVANCE Act
24 and EO 14300. Two, the Committee has embraced the EO
25 14300 direction to focus on the unique, novel, and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

1 noteworthy safety significant aspects of each new
2 reactor application of the licensing review with
3 ongoing efforts to streamline its review while still
4 providing a holistic integrated evaluation consistent
5 with its statutory obligations.

6 Three, the streamlined ACRS review takes
7 an integrated safety case approach focused on
8 fundamental safety functions of the reactor design
9 which is complementary to the detailed regulatory
10 compliance aspects of the reviews performed by the NRR
11 staff. Employing diverse review strategies is
12 especially beneficial for advanced reactors that
13 introduce many first-of-a-kind features. Four, the
14 Committee reviews are increasingly occurring in
15 parallel within NRC, beginning early following
16 application acceptance and continuing interactions
17 with the applicant and staff in a limited number of
18 focused meetings.

19 While the Committee has demonstrated its
20 ability to complete reviews ahead of established
21 schedules, we continue to identify ways to enhance
22 effectiveness and efficiency. Five, ultimately, it is
23 the completeness and quality of a license application
24 and associated supporting documents that facilitate
25 efficient and streamlined reviews. It is proven

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

1 advantageous for unique methodologies and approaches
2 to be addressed in topical reports during the pre-
3 application stage so such new or novel issues are
4 reviewed early on.

5 Sixty lessons learned are found in the
6 body of the letter. Background, the 1957 amendment to
7 the Atomic Energy Act established the ACRS as an
8 advisory committee responsible for advising the U.S.
9 Atomic Energy Commission on Reactor Hazards and Safety
10 Standards and for reviewing certain reactor license
11 applications under Sections 103 and 104. After the
12 Energy Reorganization Act of 1974, these
13 responsibilities continued with the Nuclear Regulatory
14 Commission.

15 As the world's oldest committee focused on
16 nuclear safety, the ACRS has played a key role in
17 reactor licensing, writing the development of new
18 safety requirements and design improvements. Its
19 statutory mandate remains essential today, mirroring
20 that with the committee's role at the dawn of
21 commercial nuclear power some 50-plus years ago,
22 serving to bolster public confidence that new and
23 advanced reactor technologies can be deployed safely
24 and efficiently to meet the administration's national
25 energy goals. Lessons learned, the following lessons

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

1 learned originate from recently completed reviews of
2 NuScale, Kairos' Hermes and Hermes 2, TerraPower's
3 Natrium, and the in-process reviews of GE's BWRX-300
4 and X-energy's Xe 100 reactor designs.

5 In many cases, there were common threads
6 in the applications that led to these lessons learned.
7 And in other cases, it was differences across the
8 applications that highlighted the observation. They
9 have presented generically without referencing
10 specific applicants of the corresponding staff SE.

11 The items are organized into three major
12 areas, A, safety case development, B, licensing review
13 process, and C, technology specific impacts on the
14 safety review. Safety case development, one, it is to
15 the benefit of the applicant and the staff review to
16 specifically present safety case in as transparent and
17 complete manner as possible. Ample safety margins
18 should be clearly identified to address uncertainties
19 and to compensate for a lack of operating experience
20 and incomplete validation of computational tools.

21 To the extent possible, the safety case
22 should be made clear to the public. Two, when an
23 applicant is taking a major departure from historical
24 precedent, then the development of critical aspects of
25 the safety case -- implementation of key safety

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

1 functions. More detailed focus on the alternative
2 approach being taken, and the technical rationale for
3 the departure as early in the process as possible
4 would benefit the overall licensing review.

5 Three, working that top down from safety
6 functions and associated principle design criteria to
7 systems that implement those functions. Combined with
8 a bottoms up evaluation of those unique, novel, or
9 noteworthy aspects a specific technology, for example,
10 new fuel, new coolant, new materials, allows a very
11 focused realistic integrated safety review that
12 complements rather than duplicates the staff's
13 chapter-by-chapter review approach. Review strategy
14 diversity is especially important as advanced reactors
15 introduce first-of-a-kind features, greater reliance
16 on inherent paths of safety, limited operational
17 experience, reduced experimental databases and
18 validation, and novel licensing methodologies.

19 This integrated approach results in
20 significant resource savings and is also consistent
21 with the directions provided both in the ADVANCE Act
22 and by the Commission to reinforce the Committee's
23 ongoing efforts to streamline its reviews. Four, some
24 applicants are changing or even deleting principle
25 design criteria with insufficient technical

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

1 justification. This approach dilutes the intent of
2 the criteria that have been established through
3 rigorous processes outlined in Reg Guide 1.232.

4 For new designs with little or no relevant
5 technical data or operating experience, this
6 inadequate documented technical basis potentially
7 diminishes lines of defense, weakens defense in depth,
8 and thereby increases the potential for reactor
9 accident. Licensing review process, one, many
10 construction permit applications lack sufficient
11 technical analyses and design detail to support a
12 robust safety case and demonstrate the defense-in-
13 depth. As a result, much of the technical burden
14 shifts to the operating license application.

15 While this is not new or unanticipated, we
16 reaffirm that OLs expected to use more resources and
17 potentially take more time with CP reviews. Two,
18 effective pre-application engagement and technically
19 complete topical reports early in the process lay
20 important foundations for building the safety case in
21 CP and OL applications of advanced reactors. However,
22 overly conceptual topical reports are for limited
23 value, resulting in numerous limitations and
24 conditions imposed by the staff and inefficient use of
25 review time.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

1 These types of TRs may appear to
2 demonstrate progress towards a successful licensing
3 application but in reality do not. It may tie up
4 valuable resources both by the staff and the
5 committee. Topical reports should strategically focus
6 on the foundational aspects of the safety case and
7 provide sufficient detail to clarify overall safety
8 implications.

9 Three, applications using the technology
10 inclusive content of application project, advanced
11 reactor content of application project, so-called
12 TICAP/ARCAP. Structure should directly incorporate
13 all necessary evidence to support reasonable assurance
14 finds for both the CP and OL. Omitting critical
15 details such as accident analysis that exist in
16 subsidiary documents requires audit time by the staff
17 and is inefficient.

18 Furthermore, by only presenting high level
19 information without the supporting details, it is
20 difficult to discern safety margins and key components
21 that underpin the safety case. Staff should share
22 results with the ACRS early, especially on unique,
23 novel, and noteworthy items to optimize ACRS review
24 time. Four, we have identified the following aspects
25 from recent licensing reviews as noteworthy.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

1 A, the risk informed approach used in the
2 licensing modernization project, LMP, helps focus on
3 key structures, systems, and components that impact
4 the safety case. The risk optimized safety footprints
5 of current gas and sodium reactor designs compared to
6 historic designs demonstrate an important value of the
7 LMP by focusing on risk significance. B, designs
8 represent small evolutionary changes over previous
9 review designs for use of, quote, delta review process
10 is very useful and efficient.

11 Furthermore, having a red line strike out
12 showing changes between the previous and current PSARs
13 allows reviewers to quickly identify changes and
14 assess their impact on the overall safety case. C,
15 the use of a defense line methodology is an excellent
16 structured and systematic process to implement a
17 balanced approach to addressing the adequacy of safety
18 function integration in the design, to confirm the
19 completeness of the PRA, to establish the
20 effectiveness of defense-in-depth implementation,
21 particularly for reactor designs to take credit for
22 reduced accident likelihood only as justification for
23 simplified approaches to containment and siting. And
24 that has the potentially to suitably evaluate cliff
25 edge effects.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

1 Technology specific impacts on reactor
2 safety, one, each design has distinct safety
3 attributes with technology features that require
4 experimental confirmation, sometimes only achievable
5 during initial plant startup. While computational
6 methods have advanced, reliable data remains essential
7 for verifying key safety aspects. The staff's
8 documentation at the CP stage of all the R&D items
9 necessary to support the OL application is an
10 essential and noteworthy practice.

11 Two, the safety case for a specific
12 nuclear technology is shaped by its unique attributes.
13 For liquid metals and molten salts, heat transfer is
14 relatively straightforward unless phase changes occur.
15 Instead, fast reactors require greater attention to
16 reactivity feedback and fire risks. In salt systems,
17 oxidation reduction and corrosion control and freezing
18 molten salts are more important.

19 Potentially, life limiting material
20 behavior in gas reactors maybe more of a safety issue
21 than the capabilities of heat removal. As a result,
22 direct application of historical regulatory guides,
23 analytical protocols, and safety norms from LWRs
24 without adaptation may not be effective or efficient
25 for advanced reactor licensing. For example, A, a

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

1 holistic safety review from an advanced reactor should
2 focus not only on the performance of fuel but also on
3 the safety design limits of other structural and
4 pressure boundary systems because these plant elements
5 may be more limiting in many designs.

6 B, while Reg Guide 1.203 provides a useful
7 framework for establishing and validating an
8 applicant's analytical evaluation model, many of the
9 details such as the scaling methodology are focused on
10 the complex behavior of water, flashing, critical heat
11 flux, two phase flow in large LWRs where there are
12 smaller safety margins than in advanced reactors. The
13 emphasis for advanced reactors should be on the intent
14 of Reg Guide 1.203. And the specific requirements
15 needed to be balanced against safety margins so the
16 attention remains focused on the most critical safety
17 issues for each technology.

18 A path forward, the ACRS has adopted a
19 more efficient review approach consistent with the
20 directions provided in the ADVANCE Act and EO 14300.
21 The ACRS will prioritize future reviews based on the
22 unique, novel, and noteworthy safety aspects of
23 advanced reactor designs, including both light water
24 and non-light water reactor technologies. Key
25 features include advanced fuels such as TRISO coated-

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

1 particle fuel and metallic fuel, dissolved fuels in
2 salt reactors, innovative neutron moderators, new
3 structural materials, and novel coolants.

4 These reactors also use new systems for
5 containment, heat removal, and reactivity control,
6 many of which operate passively. Understanding the
7 performance of these technologies under normal and
8 accident conditions is essential to validate safety.
9 To meet the ADVANCE Act and Commission timelines, the
10 Committee will conduct an early independent scoping
11 review to identify the unique, novel, and noteworthy
12 aspects of each application as a focus for the review.
13 The Committee will monitor staff reviews, including
14 audits and requests for information and will endeavor
15 to not duplicate their efforts.

16 Instead of reviewing every chapter, the
17 Committee will provide an integrated assessment of
18 design elements impacting facility safety. This
19 approach has already been used for the Kemmerer
20 construction permit and is being used in ongoing
21 reviews of Long Mott and Clinch River CPAs. When the
22 founders established the ACRS, the goal was to provide
23 an extra layer of protection for a new and evolving
24 nuclear regulator.

25 At the time, the complexities of nuclear

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

1 technology were unfamiliar. So the ACRS was given a
2 broad mandate to look beyond strict rules and offer
3 expert advice based on knowledge and experience. This
4 approach helps identify potential safety concerns that
5 might not be covered by regulations alone.

6 Seventy-five years later, the advanced
7 reactor technologies are again presenting similar
8 challenges. The ACRS continues to play its original
9 role offering in-depth experienced based reviews to
10 ensure safety remains the top priority. To serve the
11 public and Commission effectively, the Committee is
12 committed to making its reports clear and well
13 structured.

14 By building expert consensus and clearly
15 outline key safety issues, the ACRS provides timely
16 evidence based recommendations. Each recommendation
17 is supported by thorough, technically sound
18 explanations that highlight the safety rigor and
19 completeness of licensing actions of rulemaking.
20 Beyond licensing applications, it is essential to
21 demonstrate the capability to safely operate and
22 maintain these new facilities.

23 This includes establishing a strong safety
24 culture, developing appropriate technical
25 qualifications, gaining operating experience,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

1 providing effective oversight, managing worker
2 radiation doses, displaying commitment to worker
3 health and safety, and providing specialized training
4 such as for sodium environments and creating robust
5 maintenance practices. Additionally, the ACRS will
6 continue to perform assessments to identify ways to
7 enhance its effectiveness and efficiency. We have
8 revised our subcommittee structure by reducing the
9 number of subcommittees focusing on design centered
10 application reviews, reactor safety standards, and
11 reactor operations.

12 While the Committee has demonstrated its
13 ability to complete reviews ahead of established
14 scheduled, we continue to identify ways to enhance
15 effectiveness and efficiency. Ultimately, it is the
16 completeness and quality of a license applicant and
17 associated supporting documents to facilitate
18 efficient and streamlined reviews. Applicants should
19 be strongly encouraged in pre-application to
20 thoroughly address unique methodologies and approaches
21 in topical reports well ahead of the actual license
22 application submittals. We are not requesting a
23 response to this letter. Sincerely, Greg.

24 CHAIR HALNON: Thank you, Dave. At this
25 time, we're going to release the court reporter. And

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

1 there's no need to have the rest of the meeting
2 transcribed. So Allegra, you are released. I
3 appreciate you jumping on.

4 (Whereupon, the above-entitled matter went
5 off the record at 8:58 a.m.)
