Subject:	[External_Sender] Pallisades Nuclear Power Plant- No Significant Hazards Considerations
Date:	Thursday, October 8, 2026 2:42:03 PM

My name is Pam Richard and I live on the shore of Lake Michigan in Milwaukee, WI, vacation in Door County on Lake Michigan

I have passed Point Beach Power plant many times, just across the water, not that far from Palisades. Palisades and the Point Beach Unit 2 reactor, which are the two worst-embrittled RPVs in the country. Watchdogs have warned about Palisades' embrittlement for more than three decades. A meltdown would cause: a thousand acute radiation poisoning deaths; 7,000 radiation injuries; 10,000 latent cancer deaths; and billions in property damage downwind and downstream. Neutron-embrittlement of the reactor pressure vessel (RPV), and risk of through-wall fracture from pressurized thermal shock, are large. No NRC weakening safety regulations to accommodate continued operations at age-degraded reactors and endangering our drinking water and air.

I speak for many of us in Wisconsin, opposing Holtec International's unprecedented, unwise effort to restart the long closed Palisades atomic reactor and we object to their refueling plans.

"Viktoria Mitlyng, a senior public affairs officer for the NRC, confirmed that the fuel assembly tipped and did not drop inside the reactor vessel. She also said no radioactive materials were released as a result.

"The incident is under review and the NRC's conclusions will be documented in a future inspection report. There has been no radiological release and no workers or the public have been affected," Mitlyng said. (Sheri McWhirter | smcwhirter@mlive.com)

I am skeptical about this assurance, we've heard this before, and later it turns out there was harm caused and it indicates that in the rush to reopen the reactor safety precautions are being disregarded.

Please protect us from a potential disaster which could affect all

residents on the shore of Lake Michigan.

Pamela Richard
