24 25 (1:05 p.m.)

JUDGE BOLLWERK: Good afternoon. I'd like to begin this afternoon by introducing ourselves. In accordance with the provisions of the Atomic Energy Act, and the Regulations of the Nuclear Regulatory Commission, we are three administrative judges appointed to sit as atomic safety and licensing Board, to conduct an adjudicatory proceeding in connection with the pending challenge of intervenor Board of Commissioners of Orange County North Carolina, to the application of Carolina Power and Light Company to amend its 10 C.F.R. Part 50 License to operate the Shearon Harris Nuclear Power Plant, to expand the facility's spent fuel pool capacity. To my left is Frederick J. Shon. Judge Shon, a nuclear engineer, is a full-time member of the Atomic Safety and Licensing Board Panel. To my right is Dr. Peter Lam. Judge Lam is also a nuclear engineer and a full-time member of the Panel. My name is Paul Bollwerk, I'm an attorney and the Chairman of this Licensing Board.

As part of our judicial function relative to the Carolina Power and Light Company proceeding, we are here this afternoon to entertain oral limited appearance statements. So there will be a common understanding about what is involved in the Carolina Power and Light Company

proceeding and with respect to the limited appearance process, I'd like to take a few moments to provide some background about both.

In response to a notice of opportunity for a hearing published in the Federal Register on January 13, 1999, which can be found in volume 64 of the Federal Register at pages 2,237 to 2,241, intervenor Board of Commissioners of Orange County, North Carolina, requested a hearing to challenge the December 23, 1998, application of Carolina Power and Light Company to amend its operating license for the Shearon Harris facility to add spent fuel rack modules to spent fuel pools "C" and "D" and place those pools in service.

Thereafter, in early April and May 1999, the Board of Commissioner's submitted eight proposed issues for hearing, and CP&L and NRC staff filed responses to those issue statements, as well as the Board of Commissioner's' arguments about why it had legal standing to be a party to this proceeding.

On May 13, 1999, we conducted a daylong prehearing conference in Chapel Hill, North Carolina, during which these participants had an additional opportunity to make oral presentations regarding the issues of petitioner Orange County's standing to intervene and the admissibility of its eight proffered contentions. Based on the parties filing

and this oral argument, on July 12, 1999, in a ruling reported in Volume 50 of Nuclear Regulatory Commission Issuances beginning at Page 25, we concluded that Orange County had standing to intervene and had provided two admissible contentions or issues so as to warrant its admission as a party to this proceeding.

Generally following such a ruling, the parties would proceed under the Agency's Rules in Title 10 of the Code of Federal Regulations, Part Two, Subpart Counsel for the General Counsel, which provide for a formal, trial-type hearing. In this instance, however, because the CP&L Amendment request involves the expansion of its spent fuel pool capacity, any of the parties could invoke a separate set of procedural rules found in Subpart K of Part Two, of the Commission's Regulations. These rules provide for a 90 day period for discovery among the parties, followed by simultaneous written submissions by the parties and an oral argument before the Board addressing the central issue of whether, relative to the admitted contentions, there are any disputed issues of fact, or law that require an evidentiary hearing. Considering the parties' fillings and the oral argument, the Board is then to issue a decision that designates those matters that require an evidentiary hearing and disposes of any issues that do not require such a hearing.

As was its right, CP&L invoked the use of Subpart K procedures. As a consequence, pursuant to a Board-established schedule, the parties have engaged in discovery regarding the admitted contentions and will proved the Board with their written submissions in late December. That is what the current schedule calls for. Then Counsel for the parties will appear before the Board on Tuesday, January 4, 2000, in the Licensing Board Panel's Rockville, Maryland, hearing room to present oral argument regarding the substantive validity of the admitted contentions and whether any further evidentiary proceedings are required. And I should mention on the record that we have pending before us a motion to extend some of those time deadlines, which the Board will probably be ruling on in the next several days. But at this point we have not made any definitive ruling. We are considering it.

A Board ruling will follow sometime after the oral presentations. If the Board determines that additional evidentiary proceedings are in order, those likely would be held in A North Carolina location in the vicinity of the Shearon Harris facility.

This in a nutshell describes the NRC adjudicatory process relating to this proceeding. And this naturally prompts the question, "What then are the limited appearances' in which the Board has invited public

participation. Under Section 2.715(a) of the Commission's rule of Practice, the Board has the discretion to entertain from any person "who is not a party" a written or oral statement of his or her position on the issues in the proceeding. This provision, which was first adopted as part of the Agency's hearing rules back in 1962, recognizes there is a need to provide an opportunity for input from members of the public who, despite not having sought party status, have an interest in the subject matter of the proceeding.

As we indicated in the October 14, 1999 Federal Register notice scheduling this and other sessions here and in Raleigh, and I should mention that copies of that Federal Register notice are available over on the table over on the side where we have also our sign-up sheet, limited appearance statements do not form part of the evidentiary record of the proceeding upon which the Board must rely in making any decision on the merits of the issues proffered by Orange County.

Nonetheless, as we also recognized in that notice, the public's limited appearance statements "may help the Board and/or the parties in their deliberations in connection with the issues to be considered in this proceeding." Indeed, as you can see, like the Board, the parties to this proceeding - - Orange County, Carolina Power and Light Company, and the NRC staff - - are here to listen

to what is said this afternoon.

In this regard, I'd like to take a second now, to have the representatives of the parties identify themselves for the record. Why don't we begin with Orange County, then go to CP&L, and finally the NRC staff.

MS. GORDON: I'm Alice Gordon, representing the Orange County Board of Commissioners.

JUDGE BOLLWERK: Thank you.

MR. THOMES: Paul Thomes, Orange County Engineer. JUDGE BOLLWERK: Thank you, Sir.

MR. O'NEILL: John O'Neill, with Shaw Pittman,

Counsel for Carolina Power and Light Company.

JUDGE BOLLWERK: All right.

MR. CAVES: John Caves, Carolina Power and Light, Regulatory Affairs.

JUDGE BOLLWERK: All right.

MS. UTTALL: Susan Uttall, NRC Staff Counsel.
MR. LAWFER: Richard Lawfer, NRC Project Manager.

JUDGE BOLLWERK: All right. Thank you. Let me emphasize again that this is an opportunity to hear from those interested individuals who are not formally involved in this proceeding as parties. Consequently, the admitted parties will not be making statements here this afternoon; rather, like the Board, they are here to listen.

Finally, let me say just a word about the

procedure for making a statement. We had some individuals who preregistered and will be afforded an opportunity to speak first at this session. Once we have heard from those individuals, we will move on to anyone who registers here this afternoon. For anyone who wishes to make a statement, on the table in the corner, as I have indicated previously, there is a clipboard with a sheet to write your name and affiliation (if any). We will collect those sheets from time to time and call the speakers in the order as they sigh in. You must sign in if you wish to speak.

We will also keep watch on the time each speaker is taking and will advise you when you need to conclude your remarks. Given the number of preregistrations and the size of the audience presently, we will begin by permitting statements of up to five minutes. However, if we see that the list of speakers is growing, we reserve the right to shorten the time allotted for each presentation to ensure that everyone who wishes to speak has an opportunity to do so.

Also, I think it is important to allow the Board and the parties to hear fully the remarks of each speaker without intrusions. Accordingly, I'd ask that you respect each individual's right to address the Board by not interrupting with verbal comments or other sounds either supporting or opposing the viewpoint being espoused. I

would also mention that the remarks in this proceeding that are being presented to the Board are being transcribed. That transcript will be made part of the docket of this proceeding, and be available to the parties and the Board to review as they deem necessary and see appropriate. I would also ask that anyone that has a prepared statement that they are going to read, if you have an extra copy, or you can provide a copy to the Court Reporter, who is sitting at the table over in the corner here, as you finish, he would very much appreciate that.

At this point, why don't we begin with our first speaker of the afternoon. We have two speakers that have preregistered this afternoon. The first is Judy Hogan, H - O - G - A - N. Ms. Hogan?

MS. HOGAN: Thank you. Although this hearing is to have no direct effect on the decision the Nuclear Regulatory Commission is to make concerning CP & L's proposed doubling of "spent" fuel at its Shearon Harris Nuclear Plant, I would like to urge you to consider the risks, not only to the citizens within fifty miles of this plant, which CP&L wishes to make the single largest site for hot nuclear waste in the country, but for all North Carolina residents.

Recently, when I was taking a walk in the vicinity of Jordan Lake, which is within ten miles of the Harris

plant, I got to talking to a man who was considering buying land and wanted to know what it was like here. I live in Moncure, and I have an evacuation sign across the street from where I live. I told him that Moncure was a nice little town; people have lived here for generations, and it's a settled, family town. I like it. It's lovely to be near Jordan Lake and all the rivers that meet near here to form the Cape Fear River Basin, with the water continuing on to the ocean. The only disadvantage, I told him, is the Harris plant, which wants to increase its hot waste storage. I said we had already been able to stop the low-level nuclear dump planned for the Wake-Chatham border. Now we were working on CP&L.

He was from Apex, even closer to this plant, and said that, in his opinion, the plant was "an accident waiting to happen." He knew about the earthquake fault it sits on. He is one of many people, from whom you will probably not hear at these hearings, who live in my area and are very worried. They are convinced that CP&L simple doesn't care about their lives. Most of us in Moncure, Apex and New Hill are not rich. We have invested our life savings in our houses, farms, businesses. I would like to speak for those who worry but do not peak out.

Why should citizens in North Carolina, concerned simply about their safety, and that of future generations,

who want to prevent a serious nuclear accident in their backyard, which would affect the earth, air, and water, for fifty miles around, even need to ask the Nuclear Regulatory Agency to consider safety?

The government exists to serve the people, and this is a Federal Government Agency. It is my understanding that the only reason why CP&L will not shoos the much safer option of dry cask storage for these spent fuel rods is simply that it would cut a very small amount into their profits.

but I think the reason for their taking up a position counter to the best interests of us all goes deeper. It isn't just money. It's fear. In the late Seventies, I saw that movie, "China Syndrome," which came out at the time of the Three-Mile Island accident. What struck me then, and still strikes me, as I deal with the executives and staff at CP&L, and, I've had several E-mail exchanges with Mr. Caves, is that the staff of the company that owns a nuclear plant are apparently so afraid to risk losing face or losing their jobs, that they can't do what they think is right, even when their own children and grandchildren's lives and health are at stake.

It's a sad commentary on American society, the most prosperous in the world, that those who supply our electricity no longer see themselves as serving us, but as

outwitting our concerns for safety. We have for centuries been so proud of our democracy, and yet our large corporations more and more often show their contempt for people's health and safety. Eleven local governments within this fifty mile radius requested a formal hearing where the safety issues raised by top nuclear experts could be reviewed. This may be denied.

Yet wherever human beings are involved, there is always hope for change. I ask you to listen to your hearts, to examine your consciences. Why haven't you already told CP&L that they can't put more spent fuel rods in their pools, that they can't crowd them, because, should there be any problem, there would not be enough water circulating to cool all the material that could set off a nuclear reaction, making even a meltdown of the plant itself possible?

Once an accident occurs, we can't fix it. We simply live with nuclear pollution in our air, water, and earth for the next ten thousands years or more. We leave the Triangle area. We leave North Carolina. Where do we go? Will the Federal government re-settle us, pay for our care as our health deteriorates?

CP&L has slogan words: "Good neighbor" and "corporate citizen." Let them spend their budget for corporate donations on safe storage. Then they'd be good neighbors and citizens. Thank you for listening.

JUDGE BOLLWERK: Thank you for being with us up here, Ms. Hogan. Thank you for being with us this afternoon. The next pre-registered speaker is David L. Morrison, M - O - R - R - I - S - O - N. Mr. Morrison?

MR. MORRISON: Judge, Bollwerk, Judge Shon, and Judge Lam, my name is David Morrison, a resident of Cary, North Carolina. I appreciate the opportunity to make remarks in support of the application by Carolina Power and Light for a license amendment to increase the spent fuel storage capacity at its Shearon Harris Nuclear Power Plant which is located less than ten and a half miles from my home.

 With regard to my credentials, I have a Ph.D. in Nuclear Chemistry from Carnegie-Mellon University. I spent thirty six years in research, and research management with emphasis on energy and environmental issues at Battelle in Columbus, Ohio; the IIT Research Institute in Chicago; and the MITRE Corporation in McLean, Virginia.

In 1995, I joined the US Nuclear Regulatory Commission as Director of the Office of Nuclear Regulatory Research. While at the NRC, I chaired the International Committee on Safety of Nuclear Installation of the Nuclear Energy Agency in Paris. I have been a member of Boards and Committees of the National Research Council, the most recent of which was serving as Chair of the Committee to Review the Research Strategy for Biomass-Derived Transportation Fuels. I have an appointment as an Adjunct Professor at North Carolina State University. I am a Fellow of the American Nuclear Society and concur with the resolution of support for spent fuel storage that will be presented at this public appearance by the East Carolina Section of the ANS.

When I retired two and a half years ago, my wife and I chose the Research Triangle area, as have many others, for our retirement. We were impressed by the vibrant economic growth in the area bolstered by high-tech enterprises, the wide range of residential areas available to us, and the wealth of cultural and educational opportunities throughout the Triangle. One of the underlying assets that contribute to the attractiveness and success of the region is the assured availability of electricity generated by the Harris Plant.

In light of the challenges facing the Triangle from deteriorating environmental quality, I am puzzled by the intervention related to the license amendment to increase the spent fuel storage capacity at the Harris Plant. Nearly half of the electricity in North Carolina that is consumed, comes from nuclear power that does not emit greenhouse gases and other pollutants such as SO2, and NOx. If CP&L's nuclear operations are prematurely curtailed by lack of spent fuel storage capacity, air quality in the

Triangle will further deteriorate due to emissions from additional fossil-fired generating stations that would be needed to provide replacement electric power. Nox emissions from fossil-fuel fired replacement plants would further compound the air quality problem caused by ever increasing motor vehicle use in the Triangle.

This situation was discussed in detail in Raleigh's Sunday News and Observer where it was reported this week that Governor Hunt will formally propose new regulations to cut, and I quote: "by two-thirds the nitrogen oxide pollution bellowing out of fourteen coal-fired plants ringing the Triangle, Triad, and Charlotte."

If we in this region are serious about arresting global climate change, we must do our share under the Kyoto Protocol to reduce greenhouse gas emissions to seven percent below the 1990 levels over the next decade. If the use of nuclear power is curtailed or abandoned, it will be necessary to reduce, at great expense to us ratepayers, more than ninety percent of the CO2 emissions from coal-fired plants through efficiency improvements.

Since the Harris Plant came on line in 1987, it has been operated safely. It is one of nine plants chosen to participate in a pilot program to evaluate the new reactor oversight and assessment procedures initiated by the

US Nuclear Regulatory Commission. Data on nine performance indicators has been submitted by CP&L to the NRC for its evaluation and integration with the findings of the NRC's staff. Through the end of October 19999, all these indicators are in the highest performance category. They are labeled "Green," which signifies that the objectives established by the NRC are fully met. To me, this indicates that CP&L is conforming to the highest operational and safety standards needed to maintain safe operations.

I have made a cursory review of the documents submitted by CP&L, and by the intervenors to the USNRC that are available in the Cameron Village Library. Based on this review, I do not see any compelling argument that would negate the prior finding of no significant hazard. The risk to the public from spent fuel storage that was assessed in WASH-1400 and succeeding reviews is extremely low. Spent fuel has been safely stored at nuclear plant sites throughout the country since the 1950's. There has never been a release to the public of radioactivity from spent storage pools. Although the number of spent fuel elements in storage will increase, under the proposed amendment, the already insignificant risk to the public will continue to remain insignificant.

I applaud the efforts of the intervenors to force this public appearance. In assessing risks to the public,

there is a need to have the views of all responsible and affected parties heard. We cannot live in a risk-free society. We are fortunate, however, to live in a risk-conscious society which, through its democratic processes, has established agencies such as the USNRC to deal with these complex issues of public health and safety.

As a former Director of the Office of Nuclear Regulatory Research I have had great respect for the confidence - - in the confidence - - and confidence in the thoroughness of the technical evaluations that the staff makes of all of all the issues that arise during power plant licensing. I also know that NRC has a process whereby any dissenting positions and views by the staff members will be addressed. I am certain that the staff will carefully weigh any new information pertaining to the risks of increasing the amount of used fuel stored at the Harris plant, and will render its judgment in accordance with the risk-informed, performance-based approach that has been adopted by the Commission after many, many thoughtful deliberations.

 $\ensuremath{\text{I}}$ thank you for the opportunity to make these remarks.

JUDGE BOLLWERK: Thank you, Mr. Morrison. At this point, that was our last pre-registered speaker, why don't we take a five-minute break here, and allow any one that wants the opportunity to line up over at the sign up sheets,

and we'll proceed in about five minutes. Starting with the folks that put their names down on the sign up sheets.

(Off the Record.)

JUDGE BOLLWERK: The first speaker we have for sign-ups is R. E. Morgan, Sr., M - O - R - G - A - N, with REM Consulting.

Thank you, Mr. Chairman. My name is Richard E. Morgan, Sr. I reside at 106 Buckden Place, Cary, North Carolina.

I have been a resident of Cary for almost ten years, and a resident of CP&L's service area for forty years. This is a very progressive, and high growth area, and has been for years, as everyone knows.

Through strategic and contingency planning, Carolina Power and Light Company has repeatedly demonstrated, not only the technical capability, but the will and commitment to safe and reliable service to the communities they serve. This has been witnessed by us in the service area on many occasions, during the Carolina Blue sunshine we see out there today, as well through thunderstorms, ice storms, hurricanes, tornadoes, and floods.

Harris Plant personnel, as members of this utility, have and continue to demonstrate their ability to perform their core business in a commendable manner, which

is in itself in the best interest of the community. Industry regulators such as the Nuclear Regulatory Commission and the Institute for Nuclear Power Operations, (their own watchdogs), have routinely given Harris Plant good marks for their operation.

 From discussions in which I have been involved, CP&L's desire to expand their spent fuel capability is based on sound engineering practice, regarding design, construction and testing. A proven technology regarding handling and storage; and as previously mentioned, documented good performance from a business and community standpoint.

Also, as previously mentioned, this is a high growth area which represents significant present and future revenue to CP&L, in which they have invested a large amount of capital and human resources. It would seem ludicrous to me for a company to bite the hand that feeds it by pursuing new and untested, or ventures with a failure history that would not only jeopardize its customers from a business and health standpoint, but its own workers and their families.

Even though there are those that would propose no change, except for changes that they personally support, change will occur. Even though there are those that support zero growth, expect the growth that they propose, growth will occur. A balanced view of what the growth and changes

represent to all the stakeholders from an economic, health, and welfare standpoint is crucial to community success. That is the value of these hearings.

Carolina Power and Light has been open and candid with its plans for the future, and one only has to ask the question to be enlightened on the subject,

It is imperative that the infrastructure for change and growth that impacts the community is founded on strategic planning for the future, clear internal and external communication for understanding and support of that plan, sound engineering and business practice for internal installation, and implementation, and strong external ties for community stewardship.

I believe this to be the case regarding the requested expansion of the spent fuel pools at Harris Plant by Carolina Power and Light Company. This methodology has long been practiced by CP&L, and is well recognized by Regulators, the utility industry, business leaders and the community itself.

Thank you for allowing me to address this Board.

JUDGE BOLLWERK: Thank you for being with us this afternoon, Mr. Morgan. Our next speaker is, I have the name Eidleman. I think it's been crossed out. Does this individual wish to say anything, or is that -
MR. EIDLEMAN: I'm going to wait.

JUDGE BOLLWERK: All right. Then, Mr. John Runkle, R - U - N - K - L - E, with the Conservation Counsel of North Carolina.

MR. RUNKLE: Good afternoon, members of the Licensing Board. My name is John Runkle. I am a Board member for the Conservation Council for North Carolina. We are a statewide environmental group. In the early, well, the late seventies and early eighties, we were intervenors in the licensing for the Shearon Harris Nuclear Power Plant. And we spent a lot of time and money looking at both the records of CP&L to operate licensing plants, the safety of those plants, and had a lot of contentions, and spent a lot of time and effort on it.

In this go round, we strongly supported Orange County intervention in this matter, and to bring, we felt, very strong and real contentions to the licensing Board for their consideration. And we are, of course, find it troublesome that not all the contentions will be heard in a hearing. And I think it is very important that in these kind of matters, that they are not settled by oral arguments and attorneys talking back and forth, but actually have testimony before you that is under oath, under cross examination, and that you can really get to the real issues that Orange County has raised.

We feel that the NRC's position is fairly

troublesome, that they are in a fighting safety contentions that this time before the NRC staff has finished their analysis. As I understand it, the environmental assessment is due out in January. It makes a lot more sense to have atomic period on the whole matters of safety and environment, since I can't see how you can separate those two issues apart.

Certainly, having public hearing on whether the environmental assessment is sufficient, or whether there needs to be an environmental impact statement. But things like the analysis of which routes the waste will be traveling throughout North and South Carolina very important considerations. And certainly those routes may influence the quality of the casts they're building to withstand accidents, and certainly the, those kind of areas of just volume, and how much we're going to go, and what the time frame is for a lot of different kind of things, so we would urge you to have a series of public hearings. And certainly the formal public hearings. The formal hearings on the contentions, and I would imagine new contentions that arise after the NRC staff finishes their environmental assessment.

Most of what I came here today is just to find more facts. I probably will be writing the next week or so some written comments on it. And I'm really having a difficulty. I get stuck on this limited appearance hearing.

And you've said it twice, and it's been in the notice, and it's been in the paper, and I just don't understand it. What we say here today is not part of the evidentiary record. And you cannot consider it but it may help the Board and parties in their deliberations. Is that the correct message of this 2.715A limited appearance hearing?

If that's so, I find these limited appearance hearings, to use a legal word, I think it's pretty silly. To have people come out, and to prepare testimony that you cannot consider; and then at the same time that you say may help you in the deliberations. I don't see how you can at all put those two things together. It just does not make sense. So, although I appreciate the opportunity to talk about my concerns. If you're not going to consider them, it's really - - (Mr. Runkle walks away from the microphone).

JUDGE BOLLWERK: All right. Thank you, Sir. The next speaker is Judy Hogan.

MS. HOGAN: I already spoke.

JUDGE BOLLWERK: Oh, I'm sorry. You signed up twice. My fault. I'm not paying enough attention here.

VOICE FROM AUDIENCE: Can we have more volume on the microphone?

JUDGE BOLLWERK: More volume on the microphone? That's something I cannot control. I don't know if Mr. - - All right. The next speaker - - is it this microphone here,

or the one at the podium? The speaker microphone. Just a moment.

 The next speaker will be Gerald Drake, D - R - A - K - E, from the Physicians for Social Responsibility.

MR. DRAKE: I am an MD, and a member of the North Carolina Triangle Chapter of Physicians for Social Responsibility, and I represent them here. My personal interest in this problem begins back in the late 1950's when a small nuclear plant at Big Rock Point just ten miles from where I live was under construction. And we all thought it was just great.

Here we are getting in on the ground floor of this safe, cheap, limitless source of energy. However, the course of events changed fairly soon. In Monroe, Michigan, the first and only attempt at a commercial, liquid metal fast breeder underwent a partial meltdown. It sat there for weeks. The engineers didn't know what to do with the thing for fear of setting off a more complete melt down. It finally was managed safely but never operated as an effective source of electricity.

Then in 1975, the Energy Research and Development Administration wanted to develop a high level dump in the salt beds of northern lower Michigan, where I lived and where I grew up. And many of us felt that was a really dumb thing to do, to put this waste in a water soluble medium, in

a body of water that is the largest one on Earth.

Basically, this is part of where I come from on the nuclear power issue. Our National Organization, in the 1960's recognized that the development of nuclear power could present humanity with an insoluble radioactive waste problem. James B. Conant, Harvard President and a Manhattan Project Administrator, called it the systematic poisoning of our descendants.

Now, North Carolina Power and Light, granted that they've done a good job of managing the Shearon Harris Plant, and their other facilities, as many utilities have, with nuclear power. They plan to complete the two unfinished pools at Shearon Harris for storage of high level radioactive waste, that is the irradiated fuel rods, from the Brunswick and Robinson plants using technology which increases the density of the rods. We believe this creates unnecessary risks from additional transportation, and increased density of the fuel rods. Dry Cask storage at each of the reactors where it is produced would be a safer option.

David Lochbaum, of the Union of Concerned Scientists, and physicist Gordon Thompson, have shown that the possibility of a catastrophic accident at Shearon Harris is real. The probability is unknowable, but they can be avoided by using dry cask storage at minimal added expense.

Rustum Roy, was given the title of Professor of Science and Society at Penn State University. He was a member of the National Academy of Sciences Committee on Radioactive Waste. He said that high level waste should be left at nuclear plants for fifty years, to allow time for thermal and radioactive decay and safer handling.

Other independent experts, Marvin Resnikoff, President of Radioactive Waste Research Associates, and Arjun Makhijani, President of the Institute for Energy and Environmental Research agree. Both are Ph.D. nuclear physicists who have researched nuclear waste problem.

There is no need to rush a solution to this problem. Yale sociologist Kai Erickson said, "The rush to bury nuclear waste doesn't take it off future generations' hands, as much as it takes a solution out of their hands."

Previous speakers here today have praised nuclear power, generally. And CP&L, and it's justified. But on the other hand, there are problems developing, not just locally, but on a world wide scale. France has called a moratorium on the construction of any more nuclear plants, although they get seventy-five percent of their electricity from them.

Germany is introducing legislation to phase out their nineteen reactors. And Sweden plans to phase their twelve reactors by two thousand ten. The executive director of the electric power research institute, the research arm of the utilities, has said that hydrogen fuel cells has been the energy of the future. So there are reasons to believe we can get around the need for nuclear power.

24 25 Nuclear power has taken two thirds of the Department of Energy research and development dollars since the nuclear age began. It's time to give that type of funding to alternatives, and particularly to the more efficient end use of electricity.

I'll close here with just one more thought from an expert on the problem of waste, and this come from Alvin Wineberg, who is, I am sure you all know, is director of the Oak Ridge National Laboratories for a good many years, and then President of the Oak Ridge Associated University. One of his associates asked him, "What right does this generation have to make tons and tons of plutonium, (and I would add other high and low level waste), but probably the most poisonous material the world has ever known, without at the same time having a totally reliable and fool proof way of sequestering it from the biosphere." Wineberg answered, "No sensitive, or partly sensitive technologist may escape this feeling of guilt, nor should he. The problem is that tat the time we first unleashed nuclear energy, it was the last question that occurred to us. We are only human beings, and our crystal balls are dreadfully clouded. From

now on, we must make sure we have a consensus of the whole public. The entire society can share the guilt. Thank you. JUDGE BOLLWERK: Thank you for being with us this afternoon, Mr. Drake. The next speaker is James Olson O - L - S - O - N, from S. E. Warren.

MR. OLSON: I'm James Olson. We live in Farrington Village. We also have four daughters and five grandchildren living within the area that we're concerned about today. I'm a retired Regular Army Colonel. I've been trained and qualified and served as a nuclear weapons employment officer.

I realize that we're not talking about dropping bombs on Shearon Harris, but that actually could be, if we had an accident, could be tantamount to the same thing. We are concerned for the safety of our family, all the citizens of this area, and ask that every consideration be given to do anything within the power of this group to reduce, not only, not to expand, but to reduce any possibility of any accident occurring. Thank you.

JUDGE BOLLWERK: Thank you, Mr. Olson. The next speaker is Laura Wimbish, of Vanderkede? If I mispronounced that, I'm sorry. You can correct me if you would. It's W - I - M - B - I - S - H dash V - A - N - D - E - R - K - E - D -E?

MS. WIMBISH: B - E - C - K.

JUDGE BOLLWERK: B - E - C - K.
MS. WIMBISH: Sloppy handwriting.
JUDGE BOLLWERK: I have the same problem.

ahead.

MS. WIMBISH: I have not prepared a statement. I'm just going to speak directly as a resident of the area, and I speak from the heart. I appreciate the opportunity to speak with you, but I think when we talked about an open, public process, my hope was that CP&L would sit down with citizen groups and with residents and basically address the safety issues that some of the experts have raised.

I don't see that. They did say they would do that, but I don't see any effort on their part. And things like opening up the visitor's center really don't address our concerns. And you know, CP&L might say, this isn't real. This is safe. But I don't feel that way. I don't believe that. And I've got to sleep in my bed under the shadow of a nuclear power plant that could possibly be the strength of twenty nine Chernobyls. I've to go to sleep every night under that. I'm not going to be able to do that.

This is my home. And it's all these other people's homes. And we beg you, to please give us the right, or give us the opportunity to get the answers that we need if this is as safe as CP&L is saying it is, why won't

they sit down with us, hear our concerns, answer our questions? We really need to hear that before any of us are going to feel comfortable with any decision to move ahead. Thank you.

 JUDGE BOLLWERK: Thank you for being with us this afternoon. Our next speaker is H. A. Bullard, Jr., from the Eastern Carolina Section of A & S.

MR. BULLARD: My name is A. G. Bullard, I am appearing as the Chairman of the Eastern Carolina Section of the American Nuclear Society. I appreciate the opportunity to do this, and I am going to read a statement of support by the Eastern Carolina Nuclear Society for the spent fuel storage proposal. This will be a statement in the form of a resolution which has been drawn by the officers of the elected officers and members of the executive committee of the Eastern Carolina section.

The Eastern Carolina Section of the American Nuclear Society is a not-for-profit scientific and educational organization comprised of approximately 300 members who represent over fifteen companies, educational institution, and government agencies located in the Carolinas. The society's main objective is to promote the advancement of science and engineering related to the atomic nucleus and the allied sciences and arts. The local section of the American Nuclear Society fosters professional and

personal alliances among members and among the faculty and students of nearby colleges and universities, cooperates with other scientific and professional groups with similar objectives, and encourages public understanding of the present and future value of applied nuclear science to the community.

To this end and, whereas nuclear power provides approximately fifty per cent of the electricity generated in North Carolina, which has been used for the economic benefit of millions of North Carolinians, and thereby serves as a critical resource for the economy of North Carolina,

and Whereas, nuclear power serves as an environmentally superior energy source alternative that does not generate greenhouse gasses and, therefore, reduces the production of ozone, and

Whereas, a substantial delay in the opening of the Federal repository for permanent storage of spent fuel has extended on-site accumulation and storage of nuclear fuel, thereby challenging the capacity for spent fuel storage at operating nuclear plant, and,

Whereas, CP&L has a demonstrated record of safety in its handling and storage of spent nuclear fuel during the operations of its Brunswick, Robinson, and Harris Plants, and,

Whereas, CP&L proposes to continue the use of the

technology and procedures inherent to this safety record as it provides safe and interim storage of nuclear fuel, and

Whereas, the Harris Plant uses numerous and redundant safety instrumentation systems, with trained engineers and staff, to provide extensive and continuous monitoring of spent fuel storage,

Now, therefore, be it resolved that the elected officers and executive committee members of the Eastern Carolinas Section of the American Nuclear Society to hereby proclaim their support of CP&L's plan for interim on-site storage of used nuclear fuel this eighth day of December, 1999.

 $% \left(1\right) =\left(1\right) \left(1\right)$ Thank you for this opportunity to read this statement.

JUDGE BOLLWERK: All right, thank you for being with us, Mr. Bullard. The next speaker we have signed up is Liz Cullington, C - U - L - L - I - N - G - T - O - N, a Chatham County resident.

MS. CULLINGTON: Could I just ask if the lady who spoke from the heart, after I get through speaking, if I haven't quite finished my statement in my five minutes, if she would yield me the remainder of her time?

JUDGE BOLLWERK: Why don't you just go ahead, and we'll watch the time, and I think you'll be all right.

MS. CULLINGTON: All right. I'll try to go

quickly. I would like to thank you for allowing the public a chance to address you on this issue, and for granting a later legal hearing for Orange County on the issues of criticality and quality control.

The quality control issue is of extreme importance because it is, in fact, the major reason why this is far from a routine license amendment that has been brought to your attention.

It is of course, not a routine matter in many other ways. Firstly because it would create the largest interim spent fuel repository in the United States at a commercial reactor.

Secondly, because it would be located upwind of a vast and dense concentration of people, wall to wall houses, and daily traffic jams.

And thirdly, because it involves the reactivation of systems that were abandoned and converted to other uses over fifteen years ago.

To refocus attention on this last aspect, I must remind you that the unique cluster design of the Shearon Harris plant meant that the centrally located waste handling building was designed to serve four reactors,

JUDGE BOLLWERK: Wait a minute. I think that's the Court Reporter's. He needs that back. There you go. You might want to make sure it's okay.

MS. CULLINGTON: All right, I just wanted to diagram. It's like the potato of a Mr. Potato Head. With the four reactors and associated buildings stuck out on all four corners. When only two reactors were to be built, it was the cooling system for unit number two that was to cool the two unused pools that CP&L now wants put into service.

CP7L seems to think that the use of these pools was granted in the operating license, because the operating license was granted in unites one and two. However, the use of these pools was dependent on unit number two being constructed, and the cooling system from unit two being constructed. And neither unit two nor its cooling system are there. They exist on paper, but they've never been built.

So CP&L wants NRC to approve extending the cooling system from unit one to cool all four pools, and to merely promise not to actually fill up the pools until after an upcoming steam generator replacement outage. At which time they have said they will upgrade the extended unit one cooling system.

Right here we are terrible far out on a limb, because the requested license amendments would allow them to rerack and fill up the pools as quickly as they can. And the additional heat load has been identified by both the company and the NRC staff as an unresolved safety issue.

This makes me extremely nervous.

However, that would be the most important issue if the vacant pools were in tip top shape, and if the NRC had had an inspector standing by when the original embedded cooling pipes were installed, welded, and then concrete poured, but they didn't.

As a matter of historical context, y you should be aware that CP&L knew before the waste handling building was constructed, that they did not need to build all four reactors. But they did not want to go back and revise their construction permit application, partly to avoid delay, and partly to avoid the imposition of new safety regulations. Particularly those requiring wider separation between redundant or rather duplicate runs of electrical cables.

And this was the finding of the North Carolina State Utilities Commission. I go on to talk about them further on.

It is simply a matter of common sense that those pipes and welds that have to be in place before a concrete slab is poured, even in a small project such as a house, are under much more significant time and completion pressures than are those which remain out in the open.

Thus the possibility of error or incomplete work is much greater in just those systems that will be inaccessible to later inspection, or reinspection, or

repair. That is why, in a house project, the building inspector comes to check that piping that is going to be imbedded before the concrete pour.

But at Harris, there was no outside independent inspector to sign off on the piping before the concrete was poured. CP&L has stated that QA documents related to the embedded welds were inadvertently destroys. So that you can have no true confidence that even construction or in house inspection staff found these welds adequate before they were buried.

In 1988, the North Carolina Utilities Commission issued its final order regarding the cost of Harris, after the most extensive prudency audit and rate case in the state's history. Design, error and rework were all issues in this case, because of their impact on final cost. The commission was obviously not concerned with safety.

However, in finding of Fact Number Ten, which was not appealed, the Commission stated on page eighty six, quote: "Careful consideration of the whole record in this case leads the Commission to conclude that there is credible, substantial, and competent evidence of an unreasonable and imprudent level of errors on the Harris project." Unquote.

The order goes on to cite, quote "incomplete record-keeping by CP&L of errors and their costs." Unquote.

The Commission also found CP&L, not its contractor, primarily at fault, saying on page ninety five, quote: "A fundaments cause of imprudence was the myopic focus of construction management on fast construction at the expense of quality construction. This management flaw was observed early in the Harris construction process in a 1979 CP&L memo." Unquote.

Please note the early date, one year after the start of construction in 1978. While there is ample evidence of this problem throughout the years, I do not want you to be misled either now or later that it was only a problem in the last rush to finish the plant. To resume quoting the Commission, quoting the CP&L memo, quote quote: "when the field troops only hear production from both sides of management, and engineers and inspectors are continuously challenged for limiting production, the stage is set to play catch me if you can."

And this is a private memo from a CP&L executive to another. However, once concrete is poured, you can't catch me. To continue from that CP&L memo, quote: "During our initial operations, cases were reported where superintendents signed off concrete pour cards when initially placed in the pour box." Unquote. That pour as in p - o - u - r.

The Commission continues on page ninety nine, in

its findings, that quote: "during the first three years of construction" unquote, there was a quote: "lack of qualified construction inspectors. In 1981 the NRC cited CP&L for a violation of Federal regulations in this regard." Unquote.

In the interests of public safety, under these circumstances, I feel that you must conclude during your upcoming consideration quality control issues, that lacking solid and credible evidence that these old welds are good, you must conclude that they are bad, and that the surplus two fuel pools cannot be activated.

And remember, that the Commission found that CP&L could have designed, redesigned for two not four reactors, two not four pools, as early as 1975. When these welds were done, everyone knew they'd never be used. Right?

Lastly, and most important, I would encourage to re-read the very short section of CP&L application where they propose their alternative plan to qualify these welds. The imbedded welds, with the missing documents.

Three things seem most significant to me. Firstly, CP&L wants to construct a halo of paper showing things were all right elsewhere, other people, other welders, other times. In this situation, as described above, like trying to fight a speeding ticket with the defense that one wasn't speeding on any other day of the

year, although CP&L's record shows that they were speeding.

Secondly, CP&L proposes various pressure and video tests, inside the piping. Personally, I am not comfortable with CP&L doing any of these tests, rather than the NRC. But I must point out that the most important part of the weld, the one that QA inspectors normally look at, is on the outside. The outside is buried in concrete. There is no way to check the outside of the wields. There is no way to qualify these welds.

Lastly, CP&L is asking you to approve not the license amendment after satisfactory results of the test, but simply to approve the method. So that neither the public nor intervenors can quibble with the method or actual results.

Lastly, I would like to support other speakers who have called for CP&L to instead opt for dry cask storage at the plant of origin, not shipment and re-racking in these dicey fuel pools at Harris. By quoting from CP&L's own brochure from the Robinson plant.

Dry cask storage does not rely on water or other liquids for cooling and shielding. Dry cask storage is a promising alternative method for storing spent nuclear fuel. Sorry, I didn't read this right. "Unlike storage in pools, dry storage does not rely on water or other liquids for cooling and shielding. Since there are no moving parts such

as fans, pumps or blowers, the dry storage facility is less expensive to maintain. There is no risk of mechanical breakdowns." Unquote.

Regarding comparative costs of dry cask storage, versus opening up these two very dicey fuel pools, CP&L claims that pool storage is cheaper, but they have not included any operating costs, only the cost of the racks. They have already written off the cost of the engineering. They have not included the cost of repackaging the waste for shipment to a repository.

Regarding worker doses, CP&L states that the worker doses, or the fuel pool option would be zero. Zero. That's the dose during installation of the racks. They have refused to include in their comparison of options the worker doses during all the loading and maintenance tasks over the next five, ten, or twenty years. Workers diving in, among the racks, to do repairs, installing new fuel, and so on.

In fact, CP&L is assuming that it's discussion of alternatives is purely pro forma, and that since they have advanced a certain distance down this road, that they just need to jump over this little problem of the missing documentation, they just need to perform some calculations regarding the heat load, and everything will be fine.

Once again, I would like to thank you for the opportunity to speak to you, and I hope that you will

remember a few of the things that I said when you come to the legal hearings in January or whenever they are. Thank you.

JUDGE BOLLWERK: Thank you, Ms. Cullington, for being with us. The next speaker is Mr. Joe Capowski, C-O-W-S-K-I, from the town of Chapel Hill. I had you listed as a speaker for this evening. Is that,

MR. CAPOWSKI: Yes.

 $\,$ JUDGE BOLLWERK: You're the Mayor Pro tem, is that right?

MR. CAPOWSKI: Yes. I'll address that in a minute. I sent an e-mail letter in, asking to speak this evening. But a new commitment came up, and so I would like to speak this afternoon, if possible.

To whom do I give a Council Resolution? I have several copies of this.

 $\,$ JUDGE BOLLWERK: Give it to the Court Reporter, I think. That would be - -

MR. CAPOWSKI: Good afternoon. My name is Joe Capowski. Until this past Monday night, I was the Mayor Pro tem of Chapel Hill. And an eight year member of the Chapel Hill Town Council. I did not run for reelection, so I am history, as they say. I am also an electrical engineer, practicing electrical engineering. I have been involved in many uses of electricity for my whole career.

I want to recognize Bill Strom who is in the audience who is another newly elected member of the Chapel Hill, who is a newly elected member of the Chapel Hill Town Council. And I understand that Bill is going to say a few words in a few minutes.

I want to thank Carolina Power and Light for giving us a tour of the spent fuel rod pools this past spring. I found that the tour they gave us was a superb one, factual, and open, and they were wonderful in answering our questions. Now, one, a half a dozen of us elected officials went on that tour including Hillsboro's Mayor, Horace Johnson.

Hillsboro is Orange County's Seat. It's about thirteen miles north of here. Horace Johnson and I still could not get a satisfactory answer to our question, and this will show the meat of my request. My question is, why move spent fuel rods, or any toxic material for that matter from rural areas to an urban area that is growing like a weed. Common sense is that this move is backwards. That we should move bad stuff from urban areas to rural areas, not vice versa.

And by this way, we minimize the risk to the most number of people. The CP&L answer was, we already do it this way, and it is extremely safe. But that is not really a direct reply to the question we asked. The Chapel Hill

Town Council, this past April passed a resolution that states our concern about the matter. The resolution is three pages long, and I've given a copy to the Clerk, and I won't read all three pages, but I'll just read the two "be it resolved" clauses.

Now therefore, be it resolved that the Council of the Town of Chapel Hill calls on Carolina Power and Light to meet its responsibilities as a corporate citizen by, one, withdrawing its application to license waste pools c and d for expanded storage at the house plant, and two, to immediately begin to phase out the import of high level waste to Harris, so as to minimize additional risks placed on the public by storage in high density pools, and to revert to the safer option of dry cask storage at the generating reactors.

Now, we passed this resolution unanimously. And that itself is a substantial - - that has meaning, because there are a couple members of our Council who absolutely love businesses, and they would be - - the last thing they would ever do would be to hinder free enterprise and even they voted for this resolution.

A note about the process. I'm still a little confused. Senior CP&L vice-president, Scotty Hinnant writes in a letter to the editor, and he's quoting the NRC, Atomic Safety Licensing Board, quote: "Our statements here do not

constitute testimony, or evidence." Close quote. Mr. Hinnant then goes on to say, this is similar to how elected Councils and commissioners hear and consider limited citizen comment before making decisions.

Well, I'm sorry, ladies and gentlemen, and especially Mr. Hinnant, but that is not the way it's done in Chapel Hill. Prior to a town council decision on any permit, the Chapel Hill does very much receive bonifide evidence from anyone who comes to our lectern, including, and especially local citizens who are impacted by whatever proposal we are considering. This is one of the basic principles that undergirds our local process.

And finally, I'd like to close with a personal story. I finished grad school in the early seventies, and I went down to Los Alamos for a job interview. I was there for a week. And one of the things I did was to visit the nuclear museum there, and there I saw the mock ups of Little Boy, and Fat Man, the bombs that were dropped on Japan in World War II. And I stood there in awe that so much destructive force could be contained in such a small volume. These things looked like over sized beach balls with tail fins. And the kids in the tennis clinics use the word awesome in every third sentence, so I'll use it. This was an awesome concentration of really bad stuff.

Now, last April, as I stood looking at the

apartment complex-sized swimming pools at the Shearon Harris power plant, I had the same feeling. This was all of the spent fuel rods that had generated a quarter of the electricity in the whole state of North Carolina in the past twenty years. What an awesome concentration of really bad stuff. Okay?

Sirs, it makes no sense to bring this stuff to an urban area. It's got to go to the rural areas, as the Los Alamos was designed to be rural, and the place selected for its remoteness, it just - - it is beyond my understanding how we should move a high concentration of really bad stuff of any form into an urban area.

Thank you very much for your time.

JUDGE BOLLWERK: Thank you for being with us this afternoon, Mr. Capowski. We appreciate your comments. We now have Carl Woodard, W - O - O - D - A - R - D, from Woodard Corporation.

MR. WOODARD: I don't have a prepared statement, but I would like to say a few words.

JUDGE BOLLWERK: All right.

 MR. WOODARD: I am a licensed engineer, architect engineer. (Backfeed from the public address system, speaker was drowned out for a few words). I had an injection to check my heart. And about twenty feet before I got to a portable monitor, I heard bells ringing and alarms going

off. I had one of those injections that they give routinely in medical when they want to check your blood vessels. I was amazed at the fact that, here I am, I'm setting off the alarms, and I'm twenty feet away from the portable monitor, almost that. I thought it was somebody else that they were after.

 I had two guards come up and grab me by the arms, and said, Mister, what are you carrying in. I said, I'm carrying nothing in. I have nothing on me. They said, you're radioactive. They monitored me. And I was amazed at the safety with which this plant was being operated, and the class I had been in was operated.

I've been in many plants in my architectural engineering career, chemical, petroleum, I've done work in pharmaceutical, I've done work in nuclear. I must say, the safest plants I've ever been in without question, are the nuclear plant. I'd walk in a nuclear plant, around a nuclear reactor, and around the swimming pool, the pool any day, to go into a chemical plant.

That's not to say that they couldn't be made safer. I'm just saying my experience, and my feeling of well being, you talk about the fuel pool, and what you see. I was at PPG industries in Lake Charles, Louisiana, when a cloury vessel ruptured. How many people? Two people were killed. Several people's lungs injured. It didn't even

make the New Orleans news paper. I called my wife that night in New Orleans. I was living in New Orleans. I said, did you see the accident? No.

You don't hear about these accidents at all, but the health and safety of the public in these plants is so much - - it's not what it should be, I agree. But nuclear plants, including the storage of spent fuel, from what I've seen, is far safer than many of the things you should have around you.

If CP&L would be firing these plants with coal, let's say, they'd be burning tremendous quantities of the air you breathe, and emitting tremendous quantities of sulfur dioxide, carbon dioxide, and also, they have waste. Many thousands of tons of ashes. Any fuel you burn, including nuclear, you have waste. This fuel, I've seen it in Idaho, I've seen it in other places stored. I've seen it in some of the power plants, and I've gone through some of the procedures for their storage.

I have yet to see anything of any consequence, or concern in the way that it is stores. However, I'm not a spent fuel storage expert by any means. I don't specialize in that. I specialize primarily in my retired consulting business, and diesel generators of one sort or another. That generate power for utilities. Like in the nuclear, the emergency diesels, but one of my big clients is down in

Florida; Homestead Florida. Where they have eighteen diesel generators. They generate prime power with.

But I do go into the nuclear plants, and I feel very safe in the nuclear plants. I feel that the proposal to store this fuel in this location, and fuel pools that are built, designed for that application, it appears to me, that with appropriate safety review, it can be done, and it can be done safely. It is done routinely in other plants.

Licensing, of course, you can't guarantee absolute safety. I go get my driver's license. Am I safe? Hell no. Can I guarantee I'm not going to go out and kill somebody? No. I'm not going to hurt somebody? No. Not at all. CP&L can't guarantee nobody's not going to get hurt from this, absolutely. You're not going to find anything safe.

Solar power isn't safe. We look up at that nuclear power plant in the sky, it's raining radioactivity on us every day. I look at TMI, what happened at TMI, people try to compare it to I guess Chernobyl, things like that. But instead of being headlines, and run as being a bad thing that happened, of course it was very bad. I did read the Government's report on it. But everything worked. What amazes me, is the Nuclear Regulatory Commission, and people at, where is it, TMI, were not jumping up and down on top of tables, saying look, everything worked. We had a meltdown. Everything worked. Nobody got excessive

radioactivity. Maybe as much as a chest xray, or a little more.

I'm just stalling off. That's all I've got to say.

JUDGE BOLLWERK: Thank you, Mr. Woodard for being with us this afternoon. The last name I have on the present list is the Reverend Frances Olson. And I believe Reverend Olson you gave a statement yesterday in Raleigh. Do you want to say a few things this afternoon?

MS. OLSON: I did. I prefer to let people speak who haven't had a chance to speak today.

JUDGE BOLLWERK: When we get to the end, we'll come back to you if you still want to say something, all right?

MS. OLSON: I would still like to speak today.

JUDGE BOLLWERK: All right. At this point, why
don't we take a break. There is a sign up sheet for anyone
who came in the middle of the proceeding. If you want to
speak, you need to sign up over there. Let's take about a
ten minute break. And we'll come back at about twenty five
till.

OFF THE RECORD

1 2

JUDGE BOLLWERK: Be seated please, and come to order. We'll begin again. All right, the next speaker, and I'm going to have some trouble with the handwriting here.

Is it Sandra Marlowe? M - A - R - L - O - R - E from the 1 National Association of Atomic Veterans? 3 VOICE FROM THE AUDIENCE: She's here. JUDGE BOLLWERK: She's here? But not ready? 5 VOICE FROM THE AUDIENCE: She's outside. 6 JUDGE BOLLWERK: Why don't we go to the next 7 person, and we'll come back to her then. All right. We'll 8 come back to her. R. Hayes, A - W - N, is it Awn? R. Haymann? I apologize Sir. 9 10 MR. HUYMANN: I apologize for my awful 11 handwriting. 12 JUDGE BOLLWERK: Can you spell your last name for 13 us? 14 MR. HUYMANN: H - U - Y - M - A - N - N.15 JUDGE BOLLWERK: Thank you. MR. HUYMANN: Gentlemen, I appreciate the 16 17 opportunity to address you very briefly, and I shall take 18 very little of your valuable time. As I said, my name is Ralph Huymann. I live in Farrington Village. About sixteen 19 20 miles from this proposed nuclear concentration. And as 21 such, this meeting, and your decisions are of utmost concern 22 to my wife, myself, our neighbors, and our community. 23

In fact, it is of such concern, that should permission be granted to store more nuclear rods at the proposed site, we would definitely leave this area. Since

24

25

as I said, we are only sixteen miles away from a potential disaster of sorts. And I would like you to reflect for one moment on the economic impact on this area. Which your decision will have.

This is a very heavily populated area, and as a former speaker pointed out, this is hardly the place to bring in more nuclear waste. Your decision will have, as I said, an impact on the very heavily populated area. And my question is, will industry flock to the Triangle, will more people be anxious to move into this area? I doubt this very much indeed, and I would like to thank you for your time.

JUDGE BOLLWERK: Thank you, Sir, for coming before us today. The next speaker is James Carnahan, C - A - R - N - A - H - A - N, from the, I believe, the Orange Chathams Sierra Club?

 $\,$ MR. CARNAHAN: That is correct. Good afternoon and thank you for the opportunity to speak.

Given that, in the event of an accident which cannot be absolutely ruled out; I should say I am speaking on behalf of Orange Chatham Sierra Club, also as a twenty-plus year resident of Chatham County, I live within fifteen miles of the reactor.

Given that, in the event of an accident which cannot be absolutely ruled out, an accident that could result in catastrophic loss of life, and inconceivable

degradation of property, given that such a possibility, no matter how remote, the continuing refusal of CP&L to let this proposal be subject to a full and open public review is unconscionable, and for you to license the proposal without such a review is unthinkable.

In the event such an accident were to occur, an accident of possibly biblical proportions, keep in mind, we beg you, that responsibility will rest on your shoulders. We have seen before in this century the results of human presumption of infallibility. The Challenger disaster, the Johnstown Flood, and the Titanic come to mind, and they would pale to nothing next to the consequences if CP&L is wrong about this proposal.

It doesn't' get any more serious than this. And if it is true that our statements here today cannot be used in your decision, then you make a mockery of the democratic process, you squander our tax dollars on a "Southern" outing, and you condemn this community to the most serious jeopardy imaginable.

How in good conscience can you sit there, in a sham proceeding, if that's what this is, fostering the appearance of due process, when in fact, scrutiny of this dangerous proposal is being avoided with such arrogant determination?

If CP&L were confident of the complete safety of

this proposal, then we would expect they would welcome its examination in a public review process. We can only conclude however, from their continuing obstruction of the public's desire for the review, that in fact, they are not confident of its safety. What we have witnessed here since last spring is a corporate citizen doing everything in its power to prevent a democratic process taking place.

We find the proposal for increased storage particularly senseless given that less risky alternatives are available. On site storage at each reactor, and dry cask storage. How can this company even contemplate putting a price on all human life this proposal puts at risk. How many pennies per share will be saved to initiate an operation that could cost thousands of lives, and render uninhabitable hundreds of square miles of our landscape?

In our courts of law, we have a concept of reasonable doubt. We don't convict an accused person until we have eliminated every shred of doubt of their guilt. Given the potentially appalling consequences, if CP&L and their experts are wrong, we have no choice but to consider this proposal with the same strict diligence. It is simply prudent civic practice to subject the proposal to the most detailed and methodical scrutiny.

Let CP&L demonstrate what they would have us believe, that they are truly a responsible corporate

citizen. Let them show clear good faith; let them demand a full public review on all the issues. All the issues. Let them insist the statement taken in these hearings be counted as testimony. Otherwise, there is too much here at stake, and we urge you, we pray you to rule to open this matter to a full legitimate public deliberation. Thank you very much.

JUDGE BOLLWERK: Thank you for being with us this afternoon. The next speaker is Heidi Zehnal, Z - E - H - N - A - L. Did I mispronounce that? You may correct me.

MS. ZENAL: Z - E - N - H - N - A - L. JUDGE BOLLWERK: Thank you.

MS. ZENAL: My name is Heidi Zehnal, I'm with the Chatham Nuclear Action Group, and I live in Chatham County about fifteen miles from Shearon Harris, near Chapel Hill. And I'm here today because I do not feel safe with the plan proposal by CP&L to store the largest amount of nuclear waste in the country just a tiny distance apart, the nuclear fuels racks less than a half inch apart, in pools that have not been used for sixteen years, and for which the piping diagrams were thrown out years ago.

And where they want to have only one cooling system for four pools, that were originally designed to have two cooling systems for the four pools. This also does not make me feel safe. The fact that there is no containment, no real containment building over the pools, like there is

over a reactor, is also of concern, because as you know if there is a criticality incident, where the water didn't stay cooled, or there was an accident with loading of fuel rods, etc., radioactive gases released could be many times greater than Chernobyl, with the amount of waste that's going to be there.

And the research coming out of Chernobyl, with what I've seen, is that many people are sick. Like ninety percent of the children are sick in that area, and that's not very encouraging. And there is an alternative. We could use movable dry cask storage for older waste, as is used in plants in Europe, to store the waste at individual plants until if, and when, there's a Federal site, which is being fought at this time in other communities; if there was a site, then it could be moved.

And this would eliminate many bad scenarios. CP&L has said itself, in its literature, that this is safe, involving less pumps, blowers and fans, with no risk of mechanical breakdowns. And there's also the piping issues, and the possibilities of accidents with the water. It would be a safer and more responsible way to handle the radioactive waste that will be with us for tens of thousands of years.

Now, I wish this was a perfect world, where we could be one hundred percent sure that nothing would ever go

wrong, where equipment was perfect, people were perfect, 1 etc., but unfortunately, it is not. No matter what anyone thinks about this issue, there's literally nothing in this world that's completely infallible. We could all be in denial, and say there's no chance at all of something going wrong. Just because nothing's happened yet in the pools doesn't mean nothing will happen. This much waste has never been accumulated in one place in all of history either.

Shearon Harris has had four accidental shut-downs this year. Things do go wrong, and can go wrong. And the Brookhaven Labs has said that a waste pool accident near a highly populated area is likely, and where will it be? Will it be where most of the waste is stored, like in this area? And I think it's a sad commentary about the world we live in today, if money and profits are valued more than life itself, or the health of millions of people in North Carolina, and this beautiful environment we live in here.

If something did go wrong, no one will win. CP&L would be out of business, and destroyed with lawsuits, the NRC would have failed at its job of safequarding the health of American's citizens, and we would lose property, and many, many lives. Whether or not CP&L, or the NRC wants us this responsibility, due to the hazardous nature of the byproducts of the industry you are in, you are responsible

for the health and well being of North Carolina residents, and beyond.

So even if there's any chance of a problem, we need to all try and win, and do the safest possible thing that's technically available. We are all one family, one human race, and we need to take care of each other for things to work, and to me, taking care of each other involves doing the safest possible think you can do. And CP&L and NRC both exist because of customers.

And I hope you will take your customers' needs and concerns into account even if there is a law saying you don't need to listen to us, in this talk today. The public will continue to push for scrutiny on these issues no matter what happens. And I hope the CP&L and the NRC will choose what will make themselves look good to the people of North Carolina, which is taking the customers health and safety concerns into account, and choosing the safest method of storage. Which I believe the dry cask at individual plants, and not waste packed to closely together in pools that if the bottom of the pond, or something broke down, or a fire or other problems would ensue, a major disaster would be on our hands.

I hope the NRC will set a safe standard for nuclear waste storage for the entire country, because this type of waste is piling up, and needs to be handled in the

safest way possible everywhere in the country. Thank you very much. $\,$

JUDGE BOLLWERK: Thank you for being with us this afternoon. The next speaker is Dr. Benjamin J. Leberoff? Am I pronouncing that correctly? L - E - B - E - R - O - F - F?

DR. LEBEROFF: That's correct. Let me qualify myself first, if I may. My baccalaureate in chemical engineering was awarded by the Coker Union, fifty years ago this year. A school that is an old scholarship, unique institution in New York that was a hundred and forty years old when I got my degree. Columbia University awarded my Doctorate in chemistry; the state of New Jersey certified me as a professional engineer. I have since retired from my license.

At that time I was director of research of the Lonus Company, it was then City Lonus of Western Engineering, Ltd. And at that point the American Chemical Society gave me the privilege of creating a new magazine for innovative professions, called GemTech. It's still in existence, I'm pleased to say. And I still write for it. And as soon as I receive my responsibility, and began to think about nuclear energy, I wrote an editorial that is in the Congressional Record. It was read here by the Senator, then Senator from Alaska, and I made this point.

That whenever an engineer sees a fatal flaw, no matter how good the rest of the project is, he drops it. And I enumerated three fatal flaws that I saw in nuclear power in general. First, the fact that we are creating something with a half-life measured in thousands and thousands of years, without any intention of knowing how we are going to deal with that. As a matter of fact, one of my correspondents wrote back and said, "The country is only two hundred years old. And we're worried about what's going to happen thousands of years", something that was on this Earth, much of it in a very dilute form, and I'll come back to that.

 The second thing was, what are we going to do with terrorists, if they gain control of this material, and of course since Nineteen seventy something, a great deal of that has happened.

And the third one is what I'd really like to address. A statement made by Edmond Teller. He said, "The potential damage that would be done by nuclear meltdown is the large number approaching infinity even though the probability of that happening is a small number approaching zero. We do not know the product of zero times infinity. He concluded by saying they should not ever build another nuclear power plant on the face of the Earth. The next sentence is, they should all be built underground."

Let me talk to that issue for just a minute, because my colleague, also a professional engineer spent a great deal of time talking about relative risk. Now the first thing I'd point out to you is the fact that something is operated for ten or fifteen years without an accident tells us really very little. I have lived for seventy five years, without having as you can see, a fatal automobile accident. That tells you nothing about what will happen to me when I drive out this driveway.

The second thing is, the talked a great deal about risk, but he spoke not at all about the benefit. Whatever we do, nature has a better idea. So whatever we do, there will be risk of injury. He did not talk about benefits, so one of the things I'm seeking in my paradigm here, is where is the benefit to this community in which we're talking about putting additional risk? He also mentions the horrors of a chlorine leak. I've live through, as I recall, three such chlorine leaks. They flow away.

He mentions sulfur dioxide. Well, that's a problem, but it blows away too. He's talking about the kind of chemistry that happens outside the nucleus. The kind of chemistry that happens inside the nucleus is in a whole different category. He also confused us a little bit by talking about sulfur dioxide and carbon dioxide in the same breath. They're not in the same league. So when we talk

about risk and benefit, we have to begin to think about such things as concentration. Now, there's lots of uranium on this planet. Lots of radioactive uranium on this planet. But it's dispersed. When you begin to put it together and concentrate it, if you concentrate it enough, we get - - we talked about that earlier. If you concentrate it not quite that much, you get nuclear power.

 Now that's something I don't think we should ever have done. But having done it, we've got to live with the result. And we've got to live with the result right here in Chapel Hill in this area. The question then before you, is how concentrated you want that storage thing to be. Do you want it all here in one place, highly concentrated, or are you willing to disperse it as nature did, by leaving some of it where it is? I think that's something that really is the significant thing you have to consider.

The second aspect, the greatest, is not only what can happen, but what the probability of it doing harm is. And we've already talked about the population density. If you sit down and make a map of North Carolina, there are very few areas where the population density is as high as this one. And I cannot believe that a plant was put here in the first place. When we moved here recently, and when I told the people, they said, "Oh, yes, we told them, we told them, we told them, we told them. They're not listening." That's why

they're not here today. "We've been to meetings. We've been to meetings. They don't listen." I don't believe that. I believe you listen. I believe you listen; you have a tremendous responsibility. I respect it immensely.

So I guess the question before you is, do we want to increase the concentration, and de facto the risk and don't let anybody tell us that the more stuff there is the risk is not increased. That's not true.

The second thing is, is this the place to put that concentration. I think that the thing that we really should be doing are a bunch of comparative environmental studies. Whenever we design a plant, as engineers, we do a best case estimate, but we also do a worst case and a best case. We do the best estimate we can, and we do a worst case/best case.

So far as I know, I've not seen an environmental impact statement, nor a financial statement. That goes to the alternative of leaving the stuff where it is. And that, incidentally, Gentlemen, is the recommendation made in an article in a magazine for which I write in London called, "Chemistry Industry" in which they discuss worldwide, the long, long term storage of these things, and the concluding sentence in that is, I'll paraphrase, leave the stuff where the people who've benefited from it live.

That's all we're suggesting you do here. Now, I

am presumably the father of the petition that you heard about, that's telling CP&L, we won't buy it. If you don't consider our well being, we won't buy it. And how will that solve the problem? Because there'll be so few people buying CP&L's waste that they won't have to haul it here. And incidentally, when they haul it here, they haul it past hospitals, schools, churches, residences. So far we haven't had an accident, but I haven't' had one either.

So the question then is, "Okay, if we can turn this thing off, CP&L, I hope you hear, we can turn it back on." We can see our loyalty to our community. If you do the sensitive thing. I can't say we all would buy your power, but I sure as the devil would. And the last thing I would leave with you folks, is to do the same thing I did when I was involved in the registration of pesticides with the Federal Government. And I was involved with the registration of two drugs. In each case, I asked myself: "Would I take those drugs, would I use those pesticides around my kids." So before you, Gentlemen, is the question: "Would you buy a house in Clarendon Village where I live twenty miles from Shearon Harris. Thank you.

JUDGE BOLLWERK: Thank you for your comments, Sir. The next speaker we have listed is Bill Strom, S - T - R - O - M, or S - T - R - O - W. I'm sorry.

MR. STROM: It's "M".

JUDGE BOLLWERK: "M", S - T - R - O - M, With the Chapel Hill Town Council.

MR. STROM: Thank you for having me here. My name is Bill Strom, I'm a newly elected member of the Chapel Hill Town Council. I've been elected official for two days. And I was going to make brief comments. I think I may make them briefer, because Mr. Cowpowski tells me that I'm going to have to read this resolution, that the Chapel Hill Town Council passed into the record. So I am here to join my colleagues on the Chapel Hill Town Council, and say that I support the resolution. I support the work that the Orange County Commissioners have done in bringing information to the public, spending public money wisely to protect public health, safety, and welfare.

And I believe that this process, the process that we're involved in here must lead to CP&L giving direct answers to the questions that are being raised by the experts hired by Orange County, and the Chapel Hill Town Council, and I understand, nine other governments; a total of eleven governments who've supported this action.

As a public official, I'm charged with public health safety and welfare, and it is important that the corporation in charge of making these decision answer the questions raised by experts in an area that very few of us really have the technical expertise in. So, that said, I

need to get my son from school. I am going to read resolution 99-4-26/R-88, Resolution on Nuclear Safety in Central North Carolina.

 Whereas Carolina Power And Light seeks a Federal license amendment to double its high-level nuclear waste storage at the Shearon Harris nuclear plant in Central North Carolina, and admits the plat would become the nation's largest approved storage site for highly irradiated used nuclear fuel rods or high-level waste; and

Whereas used nuclear fuel is one of the deadliest materials on Earth, and therefore, under Federal law must be kept out of our environment for ten thousand years, and whereas problems with storage of high-level waste in cooling pools can lead to meltdowns, fires and other accidents, causing radiation releases into the atmosphere, and,

Whereas, nuclear generating and waste storage facilities rely on highly complex systems which are susceptible to technical and human error, as evidence by the three accidental shutdowns of the Harris reactor during a six week period, ending Mid March 1999, and,

Whereas, even the Nuclear Regulatory Commission, and agency with a well known history of bias toward the industry, acknowledge in a 1997 study that the probability of a high level waste pool accident is higher than previously believed and could result in tens of thousands of

cancer deaths within fifty miles around a plant, and where Nuclear Regulatory Commission information indicates the cumulative probability of one type of severe accident is one in one hundred twenty five, and,

Whereas, two of the world's top nuclear safety experts, Gordon Thompson and David Lochbaum have raised numerous specific concerns with Carolina Power and Light's proposal, including its unprecedented plan to eliminate the separate cooling and primary and emergency electrical systems originally designed for the new pools, in order to minimize costs, where such alteration places an additional burden on safety systems for the reactor, and

Whereas, Thomason and Lochbaum agree, nor can the company deny, that there are a number of initiating factors including earthquakes, equipment failures or loss of electrical power due to weather, or other reasons, which could lead to full or partial loss of cooling water resulting in spontaneous combustion of high level waste or even meltdown type accidents, and

Whereas, Cesium, is that? JUDGE BOLLWERK: Cesium.

MR. STROM: Cesium 137 is a powerful gamma emitter, and the most dangerous, damaging substance released from the 1986 accident at Chernobyl, and whereas Thompson and Lochbaum conclude that an accident at Harris could

release into the atmosphere ten times, or more, Cesium 137 than released at Chernobyl; and,

Whereas, Carolina Power & Light's pool expansion would cause at least a doubling of crane loading and handling of multi-ton fuel rod assemblies and waste casks, therefore at least doubling the probability of handling accidents; and

Whereas, due to ongoing uncertainty as to whether a permanent disposal option for high level waste will be approved in the foreseeable future, there is a likelihood that high level waste would be stored at Harris for a number of decades, or possibly longer, in cooling pools intended only for short term use, therefore increasing the risk of accidents; and,

Whereas, terrorism is increasingly seen as a legitimate threat in the United States, and nuclear facilities are regarded as potential targets by the United States Government, and,

Whereas, Carolina Power & Light has rejected numerous requests to justify its proposal to the public or to address safety concerns identified by Thompson and Lochbaum, and additionally, Carolina Power & Light has even moved legally to prevent a public hearing sought by Orange County to air some of these issues with the Nuclear Regulatory Commission, and

whereas, the current evacuation plan for the Harris facility was controversial when first developed in 1986, and has not been updated to account for the tremendous growth this region has experienced since that time, and thus cannot assure the safe removal of residents during potential accidents; and,

Whereas communities near Harris, and the greater region, already bear an undeniable and significant risk from the existing reactor and waste storage handling and transport systems, and whereas the expansion is sought to accommodate waste fro Carolina Power & Light's reactors in other areas; and,

Whereas, dry cask storage at the generating reactors is a safer storage option, as acknowledged by Thompson and Lochbaum, and is even deemed by the Nuclear Regulatory Commission to be less prone to failure than cooling pools; and whereas Carolina Power & Light states that dry casks are equally safe as pool storage, and that its expansion is based on cost savings; and,

whereas, dry storage at the generating reactors would cost Carolina Power & Light only an estimated Thirty One Million Dollars, over a fifteen period, which is a small fraction of Carolina Power & Light's net profit of Three Hundred Thirty Nine Millions in 1998 alone, or even its budget for public relations, image advertising, and lobbying

of elected officials, totaling many millions each year, and
Whereas, all citizens at risk of exposure to
radiation from accidental releases have a genuine voice in
such an important matter, and Whereas Carolina Power &
Light, by refusing and/or blocking efforts to justify its
plan to local governments, has chosen an adversarial stance
toward the public, despite the calls from nine local
governments, citizen organization North Carolina Waste
Awareness & Reduction Network, editorial boards from various
regional media, and members of the public nearest the
facility and throughout the region, encouraging Carolina
Power and Light to engage in an open examination of the
safety issues surrounding its proposal;

Now, therefore, be it resolved, that the Council of the Town of Chapel Hill calls on Carolina Power & Light to meet its responsibilities as a corporate citizen by:

1) withdrawing its application to license waste pools C and D for expanded storage at the Harris Plant.

and 2) immediately begin to phase out the import of high level waste to Harris so as to minimize additional risks placed on the public by storage in high density pools, and revert to the safer option of dry cask storage at the generating reactors.

Thank you for your patience.

JUDGE BOLLWERK: Thank you, Sir. Thank you for

taking the time to be with us, and I hope you make it to get your son on time. Let me mention, we have three speakers on the list I have in front of me. The list is over there. It is now 3:10. We've indicated we would probably conduct this until 4:00. So if you wish to speak, you should go ahead, take the time to go over now and sign up if you have not already done so.

Also, at this time, we've had some additional representatives from the Orange County Board of Commissioners join us. Would you all like to identify yourselves for the record please?

 MS. BROWN: I'm Commissioner Margaret Brown. JUDGE BOLLWERK: All right.

MR. JACOBS: I'm Commissioner Berry Jacobs.

JUDGE BOLLWERK; All right. As I've expressed to Commissioner Gordon, we do appreciate the use of your facility. Thank you very much.

MS. BROWN: You're quite welcome.

JUDGE BOLLWERK: The next individual is Barbara Alotis, A - L - O - T - I - S, with N. C. Warren.

MS. ALOTIS: Thank you. My name is Barbara
Alotis. I did not plan to speak here this afternoon, but
after having listened to so many of my fellow citizens, I
felt I could not leave without making at least one comment.
I reside in Chatham County, a rural community that is fast

becoming a very urban one. We are very concerned about what CP&L is attempting to do, in creating the largest repository of fuel rods in the Nation.

What is at question is the manner in which they want to store these rods. We urge you to consider the risks of a severe nuclear accident, should CP&L be allowed to store these rods in high density pool storage, rather than dry storage. In addition, we're asking that you require the waste at CP&L's other facilities to store this waste at their own site.

The people in Chatham County fought for many years against the proposed nuclear waste dump site, and we are willing to fight this fight, and this battle, also. I just pray and urge you to listen to the people whose lives could be affected by what action you take. Thank you.

JUDGE BOLLWERK: Thank you very much for your remarks. The next individual is Margarite Coyle, C - O - Y - L - E, also with N. C. Warren.

MS. COYLE: Thank you Gentlemen. I'm here, following the man from the Sierra Club, who spoke of a catastrophe of biblical proportions, and of the young woman who spoke about the children of Chernobyl, and also the gentleman who spoke about Cesium 137. I would like to talk about the research done by a professor Yuri Vandejewski, who was Rector of the Medical Institute in Gomel, the Republic

of Bellaruse, in Russia.

Gomel is a region that was heavily polluted by Chernobyl, thirteen years ago. Professor Vandejewski, who himself is ill with heart and gastric diseases has written of the contamination that has occurred in the Gomel region. And indeed ninety percent of the children are not healthy. There is a cancer epidemic. Cancer being only the tip of the iceberg.

Cesium 137 is causing heart dysfunctions, and other system impairments in human beings. The birthrate has diminished by thirty percent. And of the children who are born, many have genetic, and terategenic birth defects, in other words, children are being born who are monsters.

And, Gentlemen, I ask you to consider that many of the best minds of our country are concentrated here in our Triangle area. We have the universities, the research universities, we have the research Triangle, we have, I don't want to send the waste to the urban, to the rural areas. We have wonderful, wonderful rural people here, as well as a great urban concentration. And if an accident were to occur, the very same things that I've quote you, that happened in Chernobyl, and that are still happening, still occurring, thirteen years later, would occur here.

And it would be our population that we are speaking of. And it would be our children that would be

having birth defects. It would be our splendid minds who would be deteriorating, and our healthy bodies that would be cancerous, and have other impairments of the heart, and I ask you that we do not bring any more waste in. That we do not give ourselves any more risk of such an accident. Thank you.

JUDGE BOLLWERK: Thank you for being with us this afternoon. The next speaker is from the National Association of Atomic Veterans. Is it, Sandra Marlow? M - A - R - L - O - W.

 $\ensuremath{\mathsf{MS}}.$ MARLOW: Please let me know when my time is up.

JUDGE BOLLWERK: All right.

MS. MARLOW: I have a request, before I speak, that I hope you will make available to the town and the county the complete listing, a summary of incidents involving USAEC, I guess now, NRC shipment of radioactive materials the copy I have, I've got a dup., is from 57 to 61. I would like to see a complete series of these reports, as well as the accidents published by the U. S. Atomic Energy Commission, also with the Department of Commerce. I would like to see the complete set, and I'm sure the public would like to see the complete set, of what is deemed an incident, and accident, both in the shipment, and at the plants themselves.

This is December. I take cottage from my father. I happen to be Jewish. Cottage is a prayer for the dead. My father died twenty years ago from a form of cancer which at that time was rare, polysifemavera is not as rare any more. My father was one of maybe over two hundred and fifty thousand American military personnel who participated as volunteers, or guinea pigs in American nuclear weapons testing sites. He also visited and took part as a U. S. Air Force Colonel at the radioactive laboratory in San Francisco to look at the contaminated ships brought back from the testing in the Pacific. The Bikini tests of 1946.

In both incidents, after his death, I found his letters describing the contamination on the ships. The fact that they had to clean themselves. What does this have to do with high level waste near a town where I have just moved? A great deal. More than most of the people know. Because in many ways, those of us who are now called radiation survivors feel very much like Holocaust survivors. The only difference is, the enemy is us. The enemy may be you, without realizing it.

The veterans were told that they were only exposed to low level radiation. They were told by every agency in our great government. And they wanted to believe our great government, just as the citizens here want to believe you. And you want to believe the information that you've been

given from various agencies that have done research; some of which has been clandestine.

1 2

Low level radiation, according to a letter that was sent by William Howard Taft, Assistant Secretary of Defense, about a law that the veterans were concerned about, that their cancers and other illnesses, a lot dealing with the immune system, were related to their exposure at the test, if the public believed the atomic veterans, or the veterans, it would seriously undermine the entire nuclear weapons program. It would undermine NATO. It would cause the destruction of the nuclear power industry and raise serious questions about the use of low level radiation in the isotopes in the use, in nuclear medicine.

And for that reason, it was recommended, any bill helping the atomic veterans should not be passed. We have a history, as families of these veterans of having our government lie to us. I suspect it was to protect National Security, and it was not to protect public health, because the veterans were sent into dangerous situations. They were an nuclear tests, some were working on nuclear weapons, and nuclear plants, like the workers and like many of the civilians.

But the people in this town and this county, they are not here to be used. We are citizens of this great country, and we have the right to the truth. And the truth

has been hid for twenty or more years, ever since the Manhattan project. One of the veterans that was at the H-bomb tests, I forgot if it was 51, or 54. But it was one of those horrible tests, had leukemia, and he was trying to get his medical records, as were many of the veterans.

And there was a fire in St. Louis, so they say. Well, there was a fire. It destroyed the sixth floor. The people were not told, or the VA did not tell the veterans, that there were tapes, and that computers had set up various lines. But this poor veteran, through the help of a lawyer, discovered his record, and I bring here, a once secret document. It was downgraded to confidential. So it's sort of still secret. It's his medical chart. It's his blood count. Why has this country kept the secrecy of the effects of radiation hidden from the public, even from many doctors and scientists?

V A hid radiation harms. Secret division created to thwart veterans claims. Defense kept radiation policy secret. I'm sure you know about finally the research that the center for, I guess of cancer, releasing that there was an increase in thyroid cancers. Basically, I ask, on behalf of future generations, because we know that radiation doesn't just effect cancer, or cause cancer. We know it affects the central nervous system. How much, we can't tell from mice alone.

But we must keep our community safe. I don't know if this is a good alternative, but I recommend that the Pentagon consider a holding tank of water. And let's place the nuclear rods to the place where they were established for their use. Thank you.

JUDGE BOLLWERK: Thank you for being with us this afternoon. At this point, we're going to take a brief five minute break. I'm going to hold very strictly to the five minutes. We're at 3:30, just about. 3:25 will be at 3:30 by the time we start again. If you do want to sign up to speak, please do so now, so that we can make sure we have everyone listed who wants to speak, as we move toward 4:00.

JUDGE BOLLWERK: JURGELSKI? J - U - R - G - E - L - S - K - I?

MS. JURGELSKI: Yes. Jurgelski.

JUDGE BOLLWERK: All right. With the Eno River Association, right?

MS. JURGELSKI: Yes. I represent the Eno River Association. We are a support and advocacy group for the Eno River State Park. Our current membership includes about one thousand citizens from Durham, Orange, and Wake counties.

The Association elected to sign the Resolution on Nuclear Safety in Central North Carolina, in consideration of the potential environmental threat represented by the

proposed nuclear waste expansion at Shearon Harris. It made this decision after consideration of the report to Orange County by the Institute for Resource and Security Studies and a letter from the Union of concerned Scientists to the Chairman and Commissioners of the United States Nuclear Regulatory Commission dated January 22, 1999. The Association - - were you able to hear me?

 $\,$ JUDGE BOLLWERK: I could. It's the Court Reporter.

MS. JURGELSKI: - - supports the suit by Orange County to obtain a full hearing on this matter.

Our perception is that the public would be better served if the nuclear waste expansion at the Shearon Harris plant were denied. The proposed concentration of spent fuel at the Shearon Harris plant will inevitably increase the risk of accident there. And even if the odds for an accident are not great, any degree of risk is unacceptable if safer alternatives exist.

Carolina Power and Light plans to use a major part of the expanded storage capacity at its facility in Wake County to store nuclear waste from two relatively rural counties, Brunswick, and Robinson. Please note that Brunswick County has a current population of seventy one thousand five hundred one, and Robinson County has a population of one hundred eighteen thousand, six hundred

seventy eight. The total population of these two counties is one hundred ninety thousand, one hundred seventy nine.

The expanded nuclear waste storage will place at additional risk the citizens of Wake County, which has a population of five hundred ninety six thousand, two hundred forty one. The storage also constitutes a potential hazard to two neighboring counties. Durham with a population of two hundred nine thousand, eight hundred sixty one, and orange with a population of one hundred twenty thousand, five hundred forty eight. Thus, nine hundred twenty six thousand, six hundred fifty citizens, almost a million, are placed at risk by this decision to transport nuclear waste from a relatively rural area to an urban center.

Carolina Power and Light has the alternative of using dry storage to contain the waste generated at Brunswick and Robinson. this alternative might be somewhat more expensive, but our understanding is that the expense would not be exorbitant.

The folder which I have here, contains the signatures of seven hundred citizens in this area, expressing their concern over this matter to the Wake County Commissioners. These citizens are concerned about an apparent sacrifice of public welfare to corporate expediency. We hope that you will share this concern. Thank you.

JUDGE BOLLWERK: Thank you very much for your comments. The next speaker is Jim Warren, the Director of M. C. Warren. All right, lets move on then, and come back. Marty Mandell, M - A - N - D - E - L - L.

MS. MANDELL: Good afternoon. Thank you. You all have been in this area for a while now, and you see and understand what you've heard from some of us. That this area is the intellectual, the environmental center of our state, and that we are the mix of many different peoples. We have changed a lot in the past ten or twenty years. We are making great strides in the use of solar energy, and alternative fueled vehicles.

And CP&L has been very active and very helpful in this project, and we appreciate their Corporate neighborliness in this very much. However, we do not feel that their action is very neighborly, by putting us at the great risk of increasing the fuel rod deposits at their center. And that the fact that it was done without the input of our public.

We feel that Government has had a great function in opening this up to the public, and we want to thank our County Commissioners for their effort, and thank you, as the representatives of government. We hope that you will weight these issues very carefully, and make a decision that's healthy for all of us. Thank you very much.

JUDGE BOLLWERK: Thank you very much for coming to speak with us this afternoon. The next speaker we have is Stephen Shafroth, S - H - A - F - R - O - T - H, is that correct, Sir?

MR. SHAFROTH: I'm a research professor at UNC Chapel Hill. And worked for twenty years as experimental nuclear physicist, using accelerators, and another twenty years, in an accelerator based atomic physics, and now I'm working on new x-ray sources.

I am pro nuclear power. And I - - provided it can be safe. And what I feel is, that I'm also for maximizing safety, at reasonable costs. And I'm not an expert on either of these, the safety aspect, or the costs. But from everything you can tell, the dry cask storage would be safer. And this would avoid the problem of transportation of radioactive material, which can be/have problems with tornadoes, or floods, or whatever. It costs a lot of money, I don't know if that's been figured in properly, with all the insurance, and so on.

And in general, I think the problem is a matter of risk assessment versus cost. And I hope the risk assessment, and the transportation as well as the storage, has been done. Thank you.

JUDGE BOLLWERK: Thank you, Sir for your comments. MR. WARREN: Sir, I'm Jim Warren, you called my

name a moment ago.

JUDGE BOLLWERK: Right. I'm just going to put you at the bottom. We're almost finished. We'll get to you again. That's what I did with the other person. When they weren't there, I put them at the bottom. But you will definitely get a chance to speak. Trip Overholt? O - V - E - R - H - O - L - T? From Sustainable Living, Inc.?

MR. OVERHOLT: I thank you. I've been living in the community for about nine years. I have a farm about twenty miles from the plant. And I consider this issue to be the most important issue that faces certainly this region, and maybe the state.

Right now, I should probably be earning a living, in support of my family, but I'm here doing this, because I don't think there's a more important issue than this, really, to be had. I was telling the guys down at the plant, when we were down there a few weeks ago, that there is nothing that I would personally prefer, than for CP&L to be as excellent a company as they can possibly be.

I moved to this area from the greater New York area, and I knew there was a nuclear power plant here. The Three Mile accident had occurred not to much prior to my coming down here. So I wanted to know that CP&L was a good solid company, and that they would be capable of taking care of their plant, and everything.

There's nothing I would like to see than them have all the money in the world, and all the expert technical advice they can possibly have. And I think the thing that's frustrating for me, and I haven't been like a big activist in the nuclear arena. The thing that's frustrating to me is that if you have an issue of this importance, where this amount of nuclear waste is being stored, and even though the chance of an accident is small, I think the chance of one in twenty thousand, or something like that. Or one in twenty four thousand.

But whatever, with the catastrophic consequences so great, it's very frustrating for me to think that all of the technical advice that the community that has to bear the responsibility is capable of providing, and bringing to bear at their own cost, isn't something that's invited. I think that it's wrong that we shouldn't have an opportunity to bring our intelligence to bear to this situation.

And there's nothing that I would prefer to see than CP&L be shown, and have the opportunity to be as excellent as they possibly can. So even though I'm here in support of the people that want to open this process, and everything, I'm totally in favor of CP&L doing a great job. And if there's no harm that can come to the process being a more open one where we can bring in our expert testimony, and I would urge you to do so. Thank you very much.

JUDGE BOLLWERK: Thank you for being with us this afternoon. The next speaker is Jennifer Miller, M - I - L - L - E - R.

MS. MILLER: Hello, thank you. This one? JUDGE BOLLWERK: Actually, one is for the Court Reporter, and one is for - - just speak for both of them. MS. MILLER: Okay. I'm Jennifer Miller. I live in Orange County. And I'm speaking against the storage of spent fuel at Shearon Harris. And I'm also speaking for my family and for friends who couldn't be here because they had to be at work. But they have the same concerns about the safety issue. I want to echo some of the more technical, and eloquent comments that have come before me, and to say that I'm from North Carolina. And I've lived in this area for almost thirty years. And I've seen a tremendous amount of growth, and so one of the issues that comes to my mind first is the evacuation problems. The lack of adequate routes to get people out. The massive growth that's happening.

The new Mayor of Raleigh, today I heard on the radio saying, one of the three main things he wants to do right off as new Mayor of Raleigh, is to promote the growth of South Raleigh. And they've already had plenty of growth without his help. They're building hundreds of new schools in Wake County, and the growth there has been larger than

anything that the government or the school administrators could have imagined. So they have a tremendous problem, which just indicates how fast it's growing, how many new children are there, living in this thirty mile radius, and there's also Chatham County, Durham County, and of course, Orange County, and the other surrounding communities. Where a stopped school bus on one of these roads can back up traffic for a mile. I mean, just stop and go, letting kids out. You have one accident, and people can't get out.

When you think about what happened with the hurricane, this season, and people learned, the nation learned, they can't get people out of urban areas. The roads just get jammed. And that's the end of it, and people just get stuck. So the evacuation problem is a big one, I think.

And I guess my only other thought on it is that people that build a house on the beach, can't get private insurance companies to underwrite that house, because they know eventually that house will go. And if CP&L, if this is a safe facility, why can't they go to State Farm and get an insurance policy on it? They have to have Federal Government underwriting it through this Price Anderson Act. And so what are we supposed to think about that as a safety issue? Thank you.

JUDGE BOLLWERK: Thank you very much for your

comments. The next speaker is Allan Spalt, S - P - A - L - T, a Carrboro Alderman.

MR. SPALT: Thank you very much. I am Allan Spalt. I have lived in this area since before Shearon Harris was built. I'm a resident of the neighboring town of Carrboro, director of the non profit agricultural resources center, and a member of the Carrboro Board of Aldermen. I really appreciate your holding this meeting, and I thank you for that. And I thank the Orange County Commissioners in particular for their role in pursuing this important question and getting us to this point, where we have this opportunity.

Exactly one year ago today, on December 8, 1998, the Carrboro Board of Aldermen unanimously adopted a resolution calling for public hearings and an open process on the proposal to double the high level nuclear waste storage at CP&L Shearon Harris Plant. We appreciate this meeting as a part of the process.

Though I must say, I'm distressed with I read, and I hope it's not true, that it's unclear what happens to the comments at this meeting. That it's not really a public hearing, that what we say may or may not be considered. I can't really believe that anybody would participate, anybody in this sense meaning the Commission, and representatives would participate, and so I assume that we're not going

through some kind of sham process.

I'd be run out of town on a rail, if that's how we conducted our public hearing in Carrboro before our elected officials. If really, they weren't really hearings, we were just there pretending to listen, so I'm working on the assumption that you really are listening, and that you'll carry back all that's been said, and that you'll carry back to the Nuclear Regulatory Commission in a way that is really taken into account.

It should take a nuclear scientist to tell that doubling the amount of high level waste will increase the risk. How high, I'm not the one to say. But it's clear, it's an increased risk when you double the storage. And however safe it may be, it is clearly less safe than storing half the amount. And I think the increased risk is an unnecessary risk. I deal with questions of risk a lot. And risk is a lot related to what the alternatives are.

And in a case like this, where there are safer alternatives, there's no reason to accept this. People often ask the kinds of questions, would you jump off a building if it was burning, in order to escape. Well, the first thing you ought to do, is look and see if there's another way down. If it's the only way down, yes. Perhaps you would, but if there's a stairway right behind you, a fire escape, then, obviously you wouldn't.

In this case we have a fire escape. We have dry cask storage, on site at other nuclear plants, that would be less risky, and ought to be taken as the better alternative. I urge you to halt actual public hearings, if it turns out this really is not one, to fulfill our request from a year ago, and the request of numerous other citizens and bodies in this area. And I thank you for your consideration.

JUDGE BOLLWERK: Thank you for taking the time to be with us this afternoon. The next speaker is Jim Warren, W - A - R - R - E - N, Director of N. C. Warren. And I should mention, that we are coming to the end of the names I have. If you have not sighed up on the speakers list, you need to do so. We're approaching four O'clock. So everyone that's here, that wishes to speak should go ahead and sigh up on the speakers list, which is over in the corner, there. Mr. Warren.

MR. WARREN: I appreciate it. I'm Jim Warren, I'm director of NC Warren. I'd ask that you allow us the last couple of speakers a little leeway for time. I know Rev. Bolton and myself have been working on this project for well over a year, I'm not sure we can do our stuff in less than six minutes each, but I will say that the first thing I want to do, I hope the public understands just how much that the Orange County Commissioners deserves their appreciation. If they don't realize that, we'll talk some more later, but

they have done a great job in bringing this issue out.

Now, what a horrible Federal system we have. I know you Gentlemen did not create the system, but you're playing by it. These meetings are barely even a pretense of an open process. You look around here, CP&L's at the table. You've got a Court Reporter, and a tape recorder, it's all set up real nice. But it isn't fooling anybody. You've heard from other people today. We understand. Mr. Spalt came in late, he'll see more as we go. Alan, these comments aren't' part of the record. They aren't part of the process.

 This is truly a meltdown of democracy. This is not the U. S. system is supposed to work. This whole NRC system is poised right now to deny the public a chance to even have the safety issues addressed openly in a formal hearing, with two top international experts. That is the most profound injustice today. That is the injustice. On January Fourth, CP&L in Rockville, Maryland, is going to argue against ever letting those Gentlemen be heard.

It's clear to me from yesterday's meeting, and discussions with some of you Judges, you want to follow rules, and you believe in the system. We appreciate that you want to follow the rules, but it's obvious that this very same system, it's not broken, it's diseased. It's sick. Sick.

First, the whole expansion was hidden from the public. CP&L then promised repeatedly, to openly justify and resolve the safety issues. Then, they reversed that promise, and it's no wonder. They knew that this process is a labyrinth of confusion, it's totally rigged in their favor, it's a thirty day comment period on a highly technical issue, a quick preliminary rubber stamp by NRC staff, eleven local governments joined the call for an open and independent review.

Orange County brings in the top experts to review the plan, prehearing in this same room in May, to determine if they even get a chance to be heard, and you Gentlemen, to your credit, agreed that they did deserve to be heard. But then this amazing rule where CP&L is allowed one more chance to try to prevent them from having their day in court. The public is cheated by such a process.

CP&L's team of lawyers is going to try to stop that again. The two top experts on January Fourth, will sit quietly, while Orange County argues that they should be allowed to fully explain their concerns about the increased risk of a severe nuclear accident. And one of you told me yesterday that Orange County can appeal any decision it disagrees with. And then appeal again, and again. I mean, this is ludicrous. It ignores the fact that CP&L can outspend just about any entity in this state.

That's not the way democracy should work. The very laws and rules that govern this process were created over the years by the nuclear industry and its political buddies in the Congress. There's no doubt about that. The NRC and its staff, and even yourselves, are closely tied to the industry. We heard speakers earlier today, and we heard it some yesterday.

 It's interesting to me that people criticize the Government as anti nuclear. But these people we heard today, yourselves, the NRC, you're all true believers. The Pro nuclear at any cost mindset, is much less logical in my mind than those of us who raise legitimate concerns but who are denied even the chance to hear an honest debate to find the answers.

Those people who spoke on CP&L's behalf, you heard it over and over again. There's no discussion about the spent fuel plan. They can't talk about the spent fuel plan. They talk about "we're pro CP&L. CP&L's a good corporate citizen. They do a good job. Environmentalists are always wrong. CP&L, with CP&L hiding from the open debate, I'm convinced that Thompson and Lochbaum are correct when they warn about the risk of a severe accident.

You've got our statement, or I'll give you another copy of it today. I'll just run down our requests, and I urge you please, to consider the full breadth of this. CP&L

must be forced to submit an environmental impact statement. They have acknowledged that they want to use Pools C and D, primarily because of cost. Because they claim that wet and dry storage are equally safe. But based on their license application, we believe the extra cost for a safer storage plan, low density storage, combined with dry storage at the generating reactors, would cost less than one percent of CP&L's annual net profit.

CP&L has been deceiving the public on this. They've been claiming that the safer plan would cost five times more. It's not true. I would think, and I would hope that you all are curious about this. Environmental impact statement would spell this out. CP&L must be required to justify to the public how much money it would be saving its shareholders to place North Carolina at a greater risk of an accident.

Our estimate is on the blue sheet today. We've been saying it since March. We want to see CP&L's numbers. It's fair. You should require this, by the way, regardless of the NRC Staff's upcoming rubber stamp with their environmental assessment. And not require Orange County to file an appeal. That's not the way it should work.

Number two: Orange County's experts must be allowed to argue their technical and environmental concerns in a full and formal hearing. It's clear that that the risk

of a severe accident is credible. NRC's own study from 1997 confirmed it. And that the consequences could range to the truly disastrous. The NRC is not required to industry to analyze the probability of a spent fuel accident. Wonder why? Even though the B & L study did confirm that the risk is real.

Now CP&L claims that their new pools will be a continuation of what they've been doing. Well, we see that as bogus. Packing these pools with the nation's largest concentration of nuclear material with a questionable cooling and power system, which has been rigged from the original designed, altered in order to save money, but which could overtax even the reactors' cooling system, is not the same as what CP&L has been doing.

It would be the height of injustice if lawyers decide this issue, instead of technical experts. We challenge this Court please, to rise above the current process, and to recognize the unique nature of CP&L's plan. It's an entirely reasonable call that we make, and we urge you to inject some common fairness into this process. I'm concerned that if the pro industry bias of the NRC continues over the years, some of you at the NRC, sooner or later may well be involved in approving a licensing amendment that could lead to a disastrous accident somewhere in the United States.

Now, to sort of close out, this is a statement to the CP&L. You've got it in writing from yesterday. Here's more on it. You've kept claiming that yours is an open process, but you don't fool anybody. It's in the News and Observer yesterday, you keep saying it over and over, trying to make it come true somehow. If you want an open process, drop the legal barriers now. You have the right to call for a formal public hearing. Do it. Answer the tough questions instead of hiding from them. CP&L created this adversarial process, not Orange County, not the other ten local governments. Not N. C. Warren.

And I'll state once again. We would prefer to work cooperatively to resolve this. We play by the rules, which your industry created. But so far CP&L has used your big money and the biased Federal system to cheat the public out of an open process, and an honest justification of your plan. We made a reasonable request for you to openly address the risks of accidents. You've denied us. We have called on you to reconsider the safer storage option, which would cost you only a tiny amount of your profits, you have denied us.

What do you expect us to do? Do you want the public to bring thousands of people out in front of CP&L headquarters to protest? Do you want the public to bring hundreds or thousands of people to block the railroad tracks

into the plant? Do you want us to make this a big national news story, and an even worse problem for CP&L's public image?

You're pushing the public closer to a position where our only recourse is to escalate our opposition and create a major civil movement. If so, If so, we will do that. And we will be peaceful, and we will be strong. If you look around this room and you look at the past ten years in North Carolina, you will know that we have the people we have the organization, and the experience to do this, and we have the experience to win.

We were formed, N. C. Warren, as twenty one groups ran the Thermal Kem Toxic Waste incinerator out of North Carolina. N. C. Warren helped with our allies to defeat Kem Nuclear and its seven state nuclear waste dump.

Most importantly, we have the moral authority, and the responsibility to do everything possible in a peaceful manner, given the total absence of a democratic process. The public is going to remember that CP&L put us at an increased risk of a nuclear accident without even justifying it. In order to save your shareholders a little money.

Now, the NRC, again, over the years, has betrayed the public trust, and unfortunately, it seems to be getting worse. We will continue to point out that the NRC is too cozy with the industry, to the detriment of public safety.

We have Congressmen Price, and both U. S. Senators helping, and they will be a factor, believe me.

 And finally, the NRC decision here, and beyond is one thing. But CP&L can again, choose a safer plan, and at least a more open Democratic process. We're going to keep running our boycott campaign as long as it takes; well beyond any decision that NRC may have. And you're bound to know, CP&L, that we have many thousands of people behind us, and over ninety percent of the public totally agrees with us. Maybe you will be able to sell your energy in other areas after deregulation. But don't count on many customers in Central North Carolina. And I remind you.

We would rather work this issue out in a fair and open way. We don't want to continue and have a serial process. But, we are not going to stand by passively and let CP&L place Central North Carolina at the greater risk of a catastrophic accident so that you can save one percent of your profits. Thank you.

JUDGE BOLLWERK: Thank you for your comments, Sir. All right, at this point, Ms. Hill, would you take a look at the list, and see if we have any additional people signed up over there? If anyone else wishes to speak, now is the time to do so. We will be having another session tonight, but if you wish to speak this afternoon, I'd appreciate it if you would let us know right now. Raise your hand, I'll let you

sign the list right now. You want to speak? Go ahead. Why don't we have Connie Bolton, B - O - L - T - O - N.

MS. BOLTON: I don't write too well this time of day. That's Carrie, C - A - R - R - I - E.

JUDGE BOLLWERK: I'm sorry.

MS. BOLTON: That's all right. I'm Carrie Bolton. I want to thank you, fellow citizens, corporate neighbors, for the opportunity to come and say once again what I have said over and over again. For the past several years. And that is in addition to everything Jim Warren said, and the previous speaker, I absolutely do not understand the logic behind continuing with a proposal, with a process, that unnecessarily puts at risk any number of citizens in Wake, Chatham, and the surrounding region.

I left the day-care center where I serve as director, in the middle of a health inspection, and I'm the director. And I thought, I went up and said to the person, "Would it count against me really badly, if scoot out of here and go over to Orange County and say something about the environment?" And she said, "Well, no. I think everything is okay here."

The reason I felt so strongly and prioritized to come over, is because even as a part of what that person and other person who have come out does, at the day care center, is tries to help us pin point areas that are potentially

hazardous to children and adults working there.

So rather than hear me talk about how little money we have, and how challenging it is to meet a lot of regulations, they say to me, "You must make sure that the water temperature out here that is accessible to children is a certain degree, period." It doesn't matter what it costs. And I believe they do that because they recognize the importance of making sure that children are safe, not just because they're a staff supervising and willing to guard the water temperature, but because it doesn't cost that much more to put a gauge on those faucets, and other things to make sure that temperature gets beyond a certain degree.

I respect that. And what I'm saying to CP&L, our good corporate neighbor, and to this team, to the NRC, to others who are involved, judges, and all the legal persons who are involved, I believe it is time for us to say, as citizens, I'm just a mother, I'm a daycare provider, I'm a pastor of about two hundred members, and I have a lot of influence all over the region, and look forward to talking about deregulation, and the implications when it comes for power usage.

But it is time for us to say, we have been in this big tub of water, and when we got in, the water felt okay. We got used to it, it feels good. I'm speaking environmentally. But gradually, the temperature in that

water has been rising, and it has been getting hotter, and hotter.

 More and more we have become distracted by the fact that there is heat under the tub, and more intrigued with the fact that the water feels good, and the bubbles are going fine, and everybody is in their comfort zone. Someone from an environmental standpoint needs to say wait. There is a possibility we will get scalded. It is not worth it, when we talk about the amount of money involved to stand and watch. To pretend, or not notice that the water temperature is getting higher.

It is not worth it. Someone must stop and do a reality check. And say put your finger in here. And someone from the outside can certainly, and I'm considered an outsider. I'm not a part of a big network, so to speak. Can certainly say, this water is getting hot, and it has the potential to scald.

I urge you to consider the alternatives to what is being proposed. Not because the majority necessarily has said, let's stop. Let's not do this. But because even a small minority, and I know it's more than that, has the right not to be scalded. Let's stop. Let's invest. As good corporate neighbors. In the welfare, the goodwill, the peace of mind that just regular little citizens are asking for. Give me some peace of mind. Put a few more dollars

there, and do what appears to be the safest and best alternative at this point. Thank you very much.

JUDGE BOLLWERK: Thank you very much for your comments, and for being with us this afternoon. We have one more speaker, and then Rev. Olsen, do you wish to say something?

REV. OLSEN: No.

 JUDGE BOLLWERK: All right. Mollie McKinley, M - C - K - I - N - L - E - Y.

MS. MCKINLEY: Good afternoon. My message is very brief. I go to East Chapel Hill High School, one of the area's most prominent high schools. I'm a senior, I'm eighteen years old, and I represent the Class of 2000.

And I think that's very important for you guys to understand that we're aware of this, and that we're concerned. And we are today's youth. We're going off to college very soon. And it is very vital for you to know that this youth is not condoning this. We're not okay with this. And we're aware.

And our parents are some of the wealthiest parents in this area. And we have a lot of influence on what our parents decide to put their money into. And our voice matters. And this youth, is not everything the media says we are. We do have concerns, and this is one of our big concerns. East Chapel Hill High is aware of this.

I have written about this in our student newspaper. I'm staff writer for the "ECHO". So I just want you guys to know that we're aware, and we're concerned.

JUDGE BOLLWERK: Thank you very much for speaking with us this afternoon. At this point, we'll bring this proceeding to a close. It's now about 4:15. I want to thank all the speakers we've heard today. There were twenty eight individuals that addressed us. We appreciate you taking the time to come before the licensing board. And present us with your views on the Carolina Power and Light proceeding, and their proposal.

We will be here this evening again, beginning at 7:00, to take additional statements from members of the public who wish to come before the Board, and speak about the proceeding.

Judge Lam, you wish to say something?

JUDGE LAM: I would like to add to Judge
Bollwerk's remarks, I certainly appreciate being here, and
listening to your statements. I consider your participation
extremely important. It's really an integral part of our
process and let you know that each word that is spoken here
has been transcribed. And each one of us here, on the
Panel, will have a copy of the transcript available for us
to examine and to do our deliberation.

I want you to know that I take my responsibility

very seriously. All the statements here today, as well as yesterday will be considered in our deliberation. JUDGE BOLLWERK: All right. If there's nothing 5 6 7 further, Judge Shon? All right then, at this point we stand adjourned until 7:00 this evening. Thank you very much, everybody. (Off the Record.) (Whereupon, at 4:15 p.m., the meeting was recessed, to reconvenein evening session, this same day.)

EVENING SESSION

 (7:04 p.m.)

JUDGE BOLLWERK: Good evening. I would like to begin this evening by introducing ourselves. In accordance with the provisions of the Atomic energy Act, and the regulations of the Nuclear Regulatory Commission, we are three administrative judges appointed to sit as an Atomic Safety and Licensing Board to conduct an adjudicatory proceeding in connection with the pending challenge of intervenor Board of Commissioners of Orange County, North Carolina, to the application of Carolina Power and Light Company to amend its 10 C. F. R. Part 50 license to operate the Shearon Harris Nuclear Power Plant to expand the facility's spent fuel pool capacity.

To my left is Frederick J. Shon. Judge Shon, a nuclear engineer, is a full-time member of the Atomic Safety and Licensing Board Panel.

To my Right is Dr. Peter Lam. Judge Lam is also a nuclear engineer, and a full-time member o the Pane.

 $\,$ My name is Paul Bollwerk, I'm an attorney, and the Chairman of the Licensing Board.

AS part of our judicial function relative to the Carolina Power & Light proceeding, we are here this evening, to entertain oral limited appearance statements. So there will be a common understanding about what is involved in the

Carolina Power and Light Company proceeding, and with respect to the limited appearance process, I'd like to take a few moments to provide some background about both.

In response to a notice of opportunity for a hearing published in the Federal Register, on January 13, 1999, which can be found in volume 64 of the Federal Register at pages 2,237, to 2,241, intervenor Board of Commissioners of Orange County, North Carolina, requested a hearing to challenge the December 23, 1998 application of Carolina Power and Light Company to amend its operating license for the Shearon Harris facility to add spent fuel rack modules to spent fuel pools "C" and "D" and place those pools in service.

Thereafter, in early April and May 1999, the Board of Commissioner's submitted eight proposed issues for hearing, and CP&L and NRC staff filed responses to those issue statement, as well as the Board of Commissioners' arguments about why it had legal stand to be a party to this proceeding.

On May 13, 1999, we conducted a day long prehearing conference in Chapel Hill, North Carolina, during which these Participants had an opportunity to make oral presentations regarding the issues of petitioner Orange County's standing to intervene and the admissibility of its eight proffered contentions.

Based on the parties filings and this oral argument, on July 12, 1999, in a ruling reported in volume 50 of the Nuclear Regulatory Commission Issuance's beginning at page 25, we concluded that Orange County had standing to intervene and provided two admissible contentions or issues so as to warrant its admission as a party to this proceeding.

Generally following such a ruling, the parties would proceed under the agency's rules in Title 10 of the Code of Federal Regulations, Part 2, Subpart Counsel for the General Counsel, which provide for a formal, trial-type hearing.

In this instance, however, because the CP&L amendment request involves the expansion of its spent fuel pool capacity, any of the parties could invoke a separate set of procedural rules found in Subpart K of Part 2 of the Commission's regulations.

These rules provide for a 90 day period for discovery among the parties, followed by simultaneous written submissions by the parties and an oral argument before the Board addressing the central issue of whether, relative to the admitted contentions, there are any disputed issues of fact or issues of law that require an evidentiary hearing.

Considering the parties' filings and the oral

argument, the Board is then to issue a decision that designates those matters that require an evidentiary hearing and disposes of any issues that do not require such a hearing.

As was its right, CP&L invoked the use of the Subpart K procedures. As a consequence, pursuant to a Board-established schedule, the parties have engaged in discovery regarding the admitted contentions, and will provide the Board with their written submissions in late December. Then counsel for the parties will appear before the Board on Tuesday, January 4, 2000, in the Licensing Board Panel's Rockville, Maryland, hearing room to present oral argument regarding the substantive validity of the admitted contentions and whether any further evidentiary proceedings are required.

A Board ruling will then follow sometime thereafter. If the Board determines that additional evidentiary proceedings are in order, those likely would be held in a North Carolina location in the vicinity of the Shearon Harris facility. And I should note that recently the Board has received a request to extend the time for the written submissions, and for the oral argument, and anticipates ruling on that in the near future.

This in a nutshell describes the NRC adjudicatory process relating to this proceeding. And this naturally

prompts the questions, what then are the "limited appearances" in which the Board has invited public participation. Under section 2.715(a) of the Commission's rule of practice, the Board has the discretion to entertain from any person "who is not a party" a written or oral statement of his or her position on the issues in the proceeding. This provision, which was first adopted as part of the agency's hearing rules back in 1962, recognizes there is a need to provide an opportunity for input from members of the public who, despite not having party status, have an interest in the subject matter of the proceeding.

As we indicated in the October 14, 1999 Federal Register notice scheduling this and other sessions here and in Raleigh, limited appearance statements do not form part of the evidentiary record of the proceeding upon which the Board must rely in making any decision on the merits of the issues proffered by Orange County.

Nonetheless, as we also recognized in that notice, and copies of that notice are available on the table over there, for anyone who wants one, the public's limited appearance statements "may help the Board and/or the parties in their deliberations in connection with the issues to be considered in this proceeding."

Indeed, as you can see, like the Board, the parties to this proceeding - - Orange County, CP&L, and the

NRC staff $\ -\$ are here to listen to what is said to what is said this evening.

In this regard, I'd like to take a second now to have the representatives of the parties identify themselves for the record. Let's begin with Orange County, then CP&L, and finally the NRC staff.

 $$\operatorname{MR}.$$ THOMES: I'm Paul Thames, county engineer for Orange County.

JUDGE BOLLWERK: Thank you, Sir.

 MR. O'NEILL: I'm John O'Neill with the law firm of Shaw Pittmann, I represent Carolina Power and Light Company.

MR. CASE: I'm John Caves, manager of Regulatory Appearance for Carolina Power and Light, and I'd also like to introduce Scotty Hinnon who is our chief nuclear officer.

JUDGE BOLLWERK: Good evening, Sir. MS. UTTAL: I'm Susan Utall, I am staff counsel for the NRC.

MR. LAWFORD: Richard Lawford, NRC product manager.

JUDGE BOLLWERK: All right. Thank you very much. Let me emphasize again this is an opportunity to hear from those interested individuals who are not formally involved in this proceeding as parties. Consequently, the admitted parties will not be making statement here this evening.

Rather, like the Board, they are here to listen.

Finally, let me say a word about the procedure for making a statement. I've had some individuals who preregistered and will be afforded an opportunity to speak first at this session. Once we have heard from those individual, we will then move on to anyone who registers here this evening. For anyone who wishes to make a statement, on the table in the corner over there, is a clipboard with a sheet to write your name and affiliation, if any. We will collect those sheets from time to time and call the speakers in the order as they sign in. You must sign in, if you wish to speak.

We will keep a watch on the time each speaker is taking, and will advise you when you need to conclude your remarks. Given the number of preregistrations, and the size of the audience presently, we will begin by permitting statements of up to five minutes. However, if we see that the list of speakers is growing, we reserve the right to shorten the time allotted for each presentation to ensure that everyone who wishes to speak has an opportunity to do so.

Also, I think it's important to allow the Board and the parties to hear fully the remarks of each speaker without intrusions. Accordingly, I would ask that you respect each individual's right to address the Board by not

interrupting with verbal comments or other sounds either supporting or opposing the viewpoint being espoused.

Two other things I will note. The remarks, everyone's remarks in this proceeding this evening, are being transcribed and made a part of the document of this proceeding for the parties to review and use as they see appropriate. I will also mention that if you have a prepared statement that you are reading from, and you wouldn't mind providing the Court Reporter with a copy of that, or the original, if you don't need it any more, that will help him in making sure the transcription is accurate. And also you see that we have both a podium and a table here. Feel free to sit, or whichever you feel more comfortable at. It's really up to you.

With that explanation, let's begin with our first speaker. And we actually had two preregistered speakers for this evening, one of whom decided to speak this afternoon, so at this point we have one, Mr. Hubert Garner, G - A - R - N - E - R, Lee County Commissioner. Mr. Garner?

MR. GARNER: Thank you Mr. Chairman, and members of the Nuclear Regulatory Commission. If you don't mind I will sit, since I have a few aches.

 $\ensuremath{\mbox{\sc JUDGE}}$ BOLLWERK: You just need to move that one mike.

MR. GARNER: And I want to thank you for

scheduling a public hearing to get citizen input on matters of substantive concern. The free speech clause in our Constitution is one of the most cherished rights, and I'm grateful for that opportunity to be heard tonight, as are those who oppose the view that I espouse.

Most of you do not know me. I was introduced as a Commissioner. I do not speak, repeat, do not speak tonight for the Lee County Board of Commissioners. I do wish to read from some minutes we have had a little bit later.

Let me introduce myself, just a little bit. After high school, and three years in the Air Force, and about five and a half years in college, I began a teaching career as a ag teacher in Marion County, South Carolina, and I retired in 1991 after having spent more than thirty years as an educator; the last twenty five of which as dean of students at Central Carolina Community College in Sanford.

And prior to going to CCCC in Sanford in 1964, I was in the commercial world for about six years with Morton Salt Company, and later Murr Chemical. I am in my last year of the second term, four-year term, as a Lee County Commissioner. Two of which were as Chair. As I indicated, I do not speak for the Board of Commissioners, but only as an individual who is interested in what I feel like is right.

The concerns that we are addressing here tonight

were brought before the Board of Commissioners in January of this year, and the Board of Commissioners asked in its resolution, for the Boards of Nuclear Regulatory Commission, and the State of North Carolina, and if I might, Mr. Chairman, I'd like to refer to those and read from the minutes of the meeting.

The Board considered recommendation from the Environmental Affairs Board, assistant community director, Travis Avery told the Board that the environmental affairs board opposed the proposal by the technical committee of the low level radio resonating management authority concerning the decay in storage concept for the disposal of low level radioactive waste. He asks that the board consider resolution from environmental affairs board requesting that more information be provided to the public and that public appearance be held concerning the proposed expansion.

After some discussion, commissioner Adams moved to approve the following resolution which was approved unanimously and with your permission, I'll skip the whereases, and therefores, and get to a couple or three things that the board of commissioners did, because I assume you have this document in your file with you.

We asked in that meeting that the hearings in which Carolina Power and Light and their appropriate staff explain the plans to expand storage facilities for high

level radioactive waste, and that they outline the risk, and that they accept and consider public comments relative to support for or opposition to expanding such a facility in the area.

 And they also passed unanimously. So I'm going to reemphasize the fact that I speak only as a private citizen, interested in what is going on in the world around us, and whose family resides, including three children, and eight grandchildren, a small farm, a few head of cattle within three to five miles, maybe closer to seven miles from this Shearon Harris Plant. The construction, operation, and safety of Shearon Harris have been a concern of mine for some time. I watched the plant from its very beginning to the present. And earlier this year, I visited the public hearing that was held at Shearon Harris. My first real exposure was in the late 1983, when a representative spoke to our Sanford Rotary Club explaining that contrary to what we may have heard, the four cooling towers would not cause a rain forest effect for the area.

And from my front porch, or my bedroom window, I can see the operation of the single tower with its condensation effect and I'm sure he was correct in that. While employed at the college, I was able to visit Shearon Harris on a number of occasions, and as a commissioner, I attended several briefings on operations, safety, and

inspection, along with disaster preparation. It was after the Three Mile Island incident, and the Chernobyl explosion that I began to explore more fully the safety measures that were being used, and planned for Shearon Harris. As I understand the present Shearon Harris consideration, and public concern, it is a storage of spent fuel rods, pellets, in one of the vacant unused chambers until the Federally, Congressionally mandated permanent storage facility is constructed, and hopefully completed by the year 2010.

I would say, Mr. Chairman, and members of the Board, that all new actions, and most of us are aware that even travel itself involves some risk, but to me, this is a case of doing more, of what has been done safely for a number of years. And I believe every effort of precaution, safety precaution, known and available is being observed at the Shearon Harris Plant. And for my family and myself, I feel no clear, present danger that any major explosion will occur for the storage of these spent plants.

Finally, Mr. Chairman, but emphatically, members of the Board, let me say to you, that no one in the employ of CP&L or any other affiliates asked me to be present and speak tonight. This was something that I felt I ought to express. As I promised the voters of Lee County and the last two times that I campaigned and was elected a Lee County Commissioner, that I would do four things.

I would listen to the people and their concerns. I would be honest and up front with them. That I would endeavor thoroughly to get the facts before I voted on any issue. And I would vote for those things that I felt would be in the best interest for the most people of Lee County over the longest period of time. I've tried to be true to that promise by being here tonight.

 Again, I thank you for holding these public meetings, and allowing me to speak, and I would say again, if CP&L is not allowed to store these pellets at the Shearon Harris Plant, and it is not full opinion that most of us in this area will pay a higher price for electricity because they are going to have to do something with it, and if it's not done here, it will have to be done somewhere else. Thank you very much, Mr. Chairman.

JUDGE BOLLWERK: Thank you, Sir, for coming to speak with us this evening. The next speaker we had signed up was G. R. Quinn, Q - U - I - N - N.

MR. QUINN: Gentlemen, I appreciate the opportunity to speak to you tonight. I represent the Article Three Foundation, which is my own business. I'm involved with environmental and other issues related to where I live in Lee County, North Carolina.

I'd like to first off say, let's not believe what environmentalists are putting out toward the nuclear storage

facility of the Shearon Harris Plant. It's what I call junk science. No one person has ever died in a storage facility of this nature that I'm aware of, and I've been to many meetings, and not one of the environmental scientists that they had on board, has ever come out and told me that one person, any person has died because of storage of pellets for this type of material inside the United States.

The tax payers of Chatham County has spend a million dollars, nearly a million dollars fighting nuclear waste storage sites, and it came as a shock to all of us, because we found out now, that not just Chatham County is going to pay for this fighting of waste sites, but all citizens of North Carolina have to come up with this money.

Another thing the environmentalists are doing, they are playing the race card, believe it or not. If you read their literature, they're saying that the people that work at the Allied Signal Plant down in Montpelier North Carolina, which I live about six miles from, CP&L Harris Plant, the Cape Fear Plant, and Cherokee Brick and warehouse plants are all polluters, and these are all black, poor black people working at these plants. Read their literature. It will show you what they're saying about it.

They also don't like nuclear energy because it attracts more people. Once you get electricity flowing through the system, that invites more people to come in,

build homes. They don't want Hispanics, poor whites and poor blacks moving into our neighborhoods, with the electricity that's being provided for them.

In closing, I'd like to say, CP&L are good neighbors to us. My neighbors work at CP&L. They are all good, hard working, decent people. And I resent what the environmentalists are saying about CP&L. Because when they say something bad about them, that reflects on my neighbors. These are good, decent people.

CP&L's safety record, as far as I'm concerned, is unparalleled to any industry in North Carolina. They're providing the service, they provide us electricity to our hospitals, electricity to our schools, they're safe, it's a safe, clean form of energy, and these storage sites will not present a problem to anybody in our neighborhood.

And I just hope that everyone here will look at the propaganda that they're putting out there, and that they're being derogatory toward the NRC, they've called all these hearings shams. It's in the paper also. And I do want to thank CP&L for providing opportunities for our children, and for being a good neighbor. Thank you for your attention, and letting me speak.

JUDGE BOLLWERK: Thank you for coming this evening. AT this point, why don't we take about a five minute break. There are a number of people who came in.

Allow people to go over and sign up on the sign up sheet. If you haven't done so, you need to do so in order to speak. We'll take about five minutes right now, for folks to sign up, and we'll come right back.

(Off the Record.)

JUDGE BOLLWERK: All right, come to order, and we'll get started again. Let's go back on the record again. Two administrative notes; I mentioned before, some folks have come in after we discussed this, but if you do have prepared remarks that you're reading from, and you don't mind when you're done giving a copy of those to the Court Reporter, or letting him have the original. It will help him in terms of making sure that the transcription is very accurate.

Also, I see we have another representative from Orange County, if you'd like to identify yourself for the record.

MS. BROWN: I'm Commissioner Margaret Brown.

JUDGE BOLLWERK: All right, thank you

Commissioner. All right, the next speaker we have this

evening is Wells Eddleman. E - D - D - L - E - M - A - N.

VOICE FROM AUDIENCE: Does that gentleman need to
go ahead?

JUDGE BOLLWERK: He needs to leave in about fifteen minutes; I was going to let you go ahead, and then

perhaps put him in, but if you'd like to - -

VOICE FROM AUDIENCE: Why don't I defer to him?

JUDGE BOLLWERK: All right, Mr. Gold, if you'd like to go right now, we can certainly do that.

MR. GOULD: I appreciate that.

JUDGE BOLLWERK: Thank you, Mr. Eddleman. This is Mr. Dave Gould, G - O - U - L - D.

MR. GOULD: That is correct. I live about eight miles from here, and when I drive down to work, I drive up over a hill, and I see the Shearon Harris Power Plant, about twenty five miles out in the distance. I have never really minded the power plant being there, that much. I think in some instances, nuclear power may be all right.

But it disturbs me greatly, when the original design of a power plant is changed in order to bring in a greater storage capacity, and therefore, down the road, perhaps cause an incident, accidental, that might affect both me and my family. I have been following this for several months now. I have heard experts from both sides talk, and I have no reason to believe that the experts on either side are trying to pull the wool over anyone body's eyes.

But I also must say, that if I hear someone who I have a good amount of credence in, tell me that the chances for a major accident are very real, then I get a little bit

disturbed, I get a little bit frustrated, and I need to say something about it.

I think it's very important, that you folks when you come down here, understand that there are a lot of people in this area who are very concerned about the fact that things just may go bump in the night. And I think the problem really is, is when things go bump in the night, and they affect us and our children, and perhaps our children's children down the road, then somebody needs to take a real serious look at just what is happening here.

I think CP&L over the years has done a fine job. Sometimes I think CP&L tries to pull the wool over our eyes a little bit. And when I read an article in the paper like I read yesterday, from an official from CP&L in a letter to the Editor section of the News and Observer, who essentially says is that this is a safe exercise. I tend to believe him. But he doesn't say anything about the accidental part of this, and that's what bothers me.

I've been to Russia. I have seen the affects of Chernobyl. I have certainly read about Three Mile Island, and I've certainly been around here long enough to understand that things go bump in the night. My only plea to you folks is this: Listen to the experts on both sides. Understand that an expert who errs on the side of caution, when we're talking about something as catastrophic as

nuclear waste, needs to be listened to a little bit more than that expert who is saying that this is really a safe exercise.

I fear for the people of this region if something goes wrong over there, and I think that you folks should fear for the people of this region as well. We simply do not want to live in a region that has anything like it down the road, staring it in the face as that which happened in Chernobyl. I am against the increased storage capacity. I am against the whole idea that accidents don't happen. Simply because, as I've already stated, I've been around long enough to understand that accidents do happen. And this type of an accident, in my way of thinking, and I think in many other's way of thinking over here is absolutely irreversible.

And if you cannot reverse something like this, it strikes me that we need to err on the side of caution. And if we're not willing to make the error, then we have to pro-actively decide that we are simply not going to allow an accident like that to happen, or we certainly are going to minimize as much as we possibly can the risks of that; of something going wrong.

Our logic, our rational minds, tell us that we have the capacity to solve most problems, but we don't have the capacity to solve problems that affect us genetically,

that affect our living style, that affect our living condition. We need to look at the human side of this equation. We cannot get stuck on the rational side of it simply because, by staying on the rational side of things we tend to think we can fix anything.

We cannot fix a nuclear accident of the proportions that could happen, if we increase those storage dumps out at Shearon Harris. Thank you.

JUDGE BOLLWERK: Thank you, Sir, for spending the time with us, this evening. Mr. Eddleman, and thank you again to let Mr. Gould go before you, so that he can get out on time. This is Mr. Wells Eddleman, E-D-D-L-E-M-A-N. And you need to take that silver microphone and just put it down on the table in front of you. There we go.

 $$\operatorname{MR}.$$ EDDLEMAN: Yes, Sir. Are we good? Can you all hear me?

VOICES: Yes.

MR. EDDLEMAN: Good evening. I've been doing this a long time. If you members are interested, you can take a look at the transcript, and particularly, the Board order, and how it got reversed on appeal from the remand hearing on the Shearon Harris construction firm, that were heard in February and March of 1979. I think you will particularly find interesting the testimony of Mr. Floyd Cantrell, an NRC inspector, and how those hearings came about has to do with

him. And you can look it up, since I've only got five minutes, I'm going to try to move on.

I live in about twenty miles of Shearon Harris, and I think we can thank CP&L here, because now, we don't have to travel as far as they did, to ask nuclear related questions of people that we're pretty are hiding a lot of information. They attempt to control how much information gets out. And this leads to lots of problems, as I'll explain some more later. I'm also pretty impressed with their public relations ideas.

They've had people saying things like, "Well, you know, if you like having electricity, you must like this nuclear waste, is to my way of thinking, about as logical as saying, if you enjoyed the taste of pork, you'll love the taste of hog manure. Which we raise a lot of here in North Carolina. We don't the hog farmers do.

But, you know, they've had their people say so many nice things to you, and I always think if you can say something nice, legitimately, go ahead and say it. But I need to warn you, that they're buttering you up. And once you get buttered up, you may step onto a slippery slope. And here's where they can go.

One of the things they've alleged is, that because these people are conscientious, or their families live around here, or just because they work for the power

company, they won't do anything dangerous. They won't cause an accident. Well, I doubt the people who caused the Three Mile Island, or Chernobyl accidents set out to cause them. I doubt that very much. But what did happen was, they made one mistake, and another mistake, and another mistake, and another mistake, and another mistake, and so on, and after a while, it got to the point where it was beyond their capacity, and beyond the capacity of their nuclear facility, to contain the damage, or to prevent the damage, rather.

Some of the damage at Three Mile Island was contained, thank God. But this is the problem. You make one mistake; you put the nuclear plant near a highly populated area, you make another mistake, you locate it upwind of the population concentration. You make another mistake, well, you misestimated what they would be able to do to handle the nuclear waste.

So you cram some more in, more than was designed. Now, you cram some more in, and some more in, and some more in. Well, it gets to be serious risk. And there's a lot of danger, because it's a nonlinear process. It's not like well, you run the stop sign one time, and then you run it again, and there's not more additional risk. Especially if you didn't look. It gets worse.

 $$\operatorname{\textsc{There}}'s$$ also this whole idea of trusting them. I'd like to give you a North Carolina example of what

happened to some people who trusted CP&L. Our electric cities. The operate their own city electric sales systems. A good many years ago, CP&L invited them to buy into their power plant, including, of course, the Shearon Harris plant. And they trusted CP&L. They were very trusting, kind of like these Chamber of Commerce people that have testified how much they trust CP&L.

And because of that, their economics of their electric systems is now destroyed. They have higher electric rates, due to the high cost of power out of the Shearon Harris plant. They have more power than they can use contracted for, because they believed the erroneous estimates provided by CP&L and their allies. And so now, they've been destroyed economically, because they trusted CP&L.

Well, being destroyed economically is bad enough. But being destroyed radioactively is a lot more serious. Now, I'd like to move on to some problems with the truth. Of course, it's real difficult to arrive at truth. I don't envy you your task here, but let me take one example of fooling the public, or attempts to do so from CP&L's so called facts. They say we're doing the same this, and the same that and the same the other, and quote "storing them in the same way". Now, this is not true.

This is false. They are storing them in a

different set of racks, closer together, more radioactivity. It ain't the same. But there's more to be had along these lines. Let's take Mr. Henick's statement published in the News and Observer. I checked in with them to make sure CP&L hadn't requested any corrections, and that this was as submitted by CP&L; they told me it was, and they hadn't requested any corrections.

Okay. Mr. Henick goes on and on about the review process, saying its thorough, open, independent, as required by law, yadda, yadda, yadda, yadda, yadda. Okay. Sounds good. What's the truth problem here? The problem is in what he omitted to say. He omitted any mention that throughout this process CP&L has done everything they can to prevent public hearings. They've lobbied against these resolutions for open hearings. They've lobbied against Orange County getting involved. They've challenged Orange County's standing. They've challenged all their contentions, and now they challenge them again under Subpart "K".

Well, the problem is, it's hard to tell when somebody's presenting something and falsifying by omission. And I'd like to suggest to you that unless you consider that their witnesses are like Bill Clinton, and the waste is name Lewenski, and you investigate on that basis, you won't be able to avoid the omissions that they put into their

information.

Let me give you another example. The so called probability calculations, where you may have seen this supposed finding of no significant hazard. I know it's not under your jurisdiction. But I want to mention this for a reason that you'll see. The claim is, that by doing this process of moving the nuclear waste, and moving it back and forth inside the fuel building, they won't create either a greater probability, or a greater consequence of an accident. Well, this is blatantly false.

In the first place, whenever you do something that has a fixed probability, if indeed it had a fixed probability, the more times you do it, the more times you do it, the more chances there are that the wrong thing is going to come up instead the right one. Moreover, the more waste you have in there, the more serious an accident you can have, particularly in the most serious types of accidents. So, it's just plain wrong, and the statistical thing about the more times you do it the more risk you have, is something that anybody who's studied the most elementary statistics knows.

Now why then, would CP&L make such a blatantly false statement in their application, and why would the NRC staff rubber stamp such a blatantly false statement, so eagerly, and why would the Nuclear Regulatory Commission's

Commissioners, when this was brought to their attention by David Lockbaum of the Union of Concerned Scientists, last January have done nothing about it?

 I'll bet everybody's mystified, except the lawyers. Lawyers understand that if you avoid making this false certification, then it triggers more kinds of detailed reviews and legal requirements. And in order to avoid them, they're willing to make false statements. And giving they're willing to falsify that, you've got to watch out for whatever else they say.

Finally, I'd like to refer to the references to the accuracy and care with which things are done in the nuclear industry, and I think we all endorsed the concept. If you're going to do something, especially something dangerous, it's a very good idea to do it with the best accuracy and care. But here I'd refer to the calculations of heat removal capacity for these spent fuel pools. All during 1998, CP&L was telling the NRC, including in written information, that they were going to be short of cooling capacity.

Then, not at the eleventh hour, but at the thirteenth hour, after all this stuff was filed, and Orange County's experts had had to make their declarations, and so on, CP&L brings in a new calculation, and suddenly there are millions and millions and millions of extra Btu's available,

and not only that, but right here in this room, if I recall correctly, Mr. O'Neill gets up and says, I know I can't argue this. And Judges, I submit, that you could very properly have said to him, that's right, Mr. O'Neill, so please put it away and stop referring to it.

But instead, they were allowed to bring out this thing, the roots of which have never been made public, as far as I know, never been cross examined, never even been examined in detail as far as we can find out. And argue from it, and use it as a basis to avoid inquiry into the heat removal issue, which is the key to the serious accident potential of this. The most serious accident potential that I'm aware of; there may be worse.

So it's very difficult to arrive at the truth. And you look at these safety records, and they say, well, you know, we've never had a mission to Mars crash until a couple of years ago. And I've got to say, it looks like the Martians are doing a better job of protecting their planet, than we are of protecting ours.

Finally, I'd like to say one more thing. You've heard a lot about process. I feel like, if I choose to accept a risk and I'm the one who has to accept all the consequences, it won't hurt anybody else if something goes wrong, I have the right to do that. I have a problem when somebody wants to impose a risk on me. And that's what I

believe CP&L is doing.

They're imposing a risk, not only on me, but on all the property owners. And you can imagine what the Chamber of Commerce is going to say. Radioactive waste capital of eastern America? Not a very good slogan. And if something goes wrong, of course, there will be no Chamber of Commerce. You don't hear much from the Chernobyl Chamber of Commerce these days.

Now, I know I've presented some these things in a humorous context. But I emphasize to you that this is an extremely serious matter. I know it, you know it, everybody knows it. There is just one more thing I'd like to say. As you all as judges are well aware: If CP&L would merely request a public hearing on all these issues, it would have to be implemented. I don't even see any time limitation. I think if they stood up and did it now; said, we request a public hearing, open, we waive Subpart "K" we've changed our minds, it could be done. Now I think the probability of them doing that is rather low. But I'd certainly encourage them to do it. Because if we get a less than thorough examination of these issues, we all lose.

JUDGE BOLLWERK: Thank you Mr. Eddleman. Our next speaker is Elizabeth Curtis, C-U-R-T-I-S. You're going to need to come up to the microphone, or it's not going to get transcribed.

1 VOICE FROM AUDIENCE: (Inaudible). 2 COURT REPORTER: Ma'am, please come to the mike. 3 JUDGE BOLLWERK: Ma'am, I would suggest you come 4 to the front if you want to do it all together. We want the transcription to show it all. That's all right. Not a 5 problem. You need to stay behind the microphones, here and 6 7 here. There you go. 8 I'm going to ask if you each could identify 9 yourselves, please? 10 VOICE: Yes. I'm Nancy Woods. JUDGE BOLLWERK: Do you want to spell your last 11 12 Woods? W - O - O - D - S? name? 13 MS. WOODS: That's correct. 14 ELIZABETH CURTIS; QUINN BERJ, B - E - R - J; LIZA 15 FARMER; BETSY BRENDA, B - R - E - N - D - A; EMMA STEIN; 16 JUDGE BOLLWERK: S - T - E - I - N? 17 MS. STEIN: Correct. RUTH ZALPH, Z - A - L - P - H; LORI HOYT, H - O -18 19 Y - T; 20 JUDGE BOLLWERK: All right, very good. Mr. Court 21 Reporter, do you have all those? 22 COURT REPORTER: Yes. JUDGE BOLLWERK: All right, very good. 23 24 EIGHT LADIES SINGING: (Camptown Races) 25 We're Ragin' Grannies, singing our

	223
1	song
2	Doh dah, doh dah
3	We think your plan is terribly
4	wrong!
5	All the doh dah day.
6	Gonna rage and yell
7	Listen up, CP&L.
8	We've had enough
9	Of your secret stuff
10	All the doh dah day!
11	Radiation's unsafe
12	Don't bring more to this place!
13	Hear our voice
14	There's another choice
15	We speak for the human race!
16	We're Ragin' Grannies singing our
17	song
18	Doh dah, doh, dah
19	We think your plan is terribly
20	wrong!
21	All the doh dah day.
22	"Acceptable risk's" not right
23	For this we're going to fight:
24	Design your storage in a safer way!
25	Let's make a start today.

(Jingle Bells) CHORUS: Will it be our safety Or will it be their dough This is what's at issue here It's what we need to know NRC, listen up Don't throw our words away You should decide in public And hear what we have to say. All safety issues answered They promised us last year But, hearing issues experts raised They hide away in fear. They really have no clue Of what with it to do So hide it out of sight today Pretend it's gone away. (Chorus repeated) For less than one percent Of profits that they make They could use a safer way To store that risky waste The Danger from that stuff Ten thousand years it stays But CPL wants to make sure

It's the citizen that pays.
(Repeat Chorus)

JUDGE BOLLWERK: Thank you very much, ladies. Seems like the local TV stations are never here when you need them. All right. The next speaker we have is Tony Overshaw, O - V - E - R - S - H - A - L - L, did I get that correct, Sir?

MR. OVERSHAW: Yes. I'm Tony Overshall, a resident of Chapel Hill, and it's going to be a hard act to follow the Ragin' Grannies, even though I disagree with them.

But I want to say I'm in favor of approving the license of CP&L. And it's for the following reason. The method of storage has a very long track record. There's dozens, and dozens of nuclear power stations. They've been in operation anywhere from twenty to forty years, now. They've been storing these rods, not just a Shearon Harris, but elsewhere in this particular manner.

I've been following this, these kinds of issues. I've never heard of any problems that resulted from this method of storage. So, I don't see that there's any risk involved here, unless some of the previous speakers who would like to live in truly a zero risk society. And I wonder why they ever drive, or do other things that are at higher risk that what this will involve as far as I'm

concerned.

Now the reason I speak is not to tell you what I think. You've heard other people also approve. But there's a very sorry development that occurred here for a little over fifteen years involving the low level radiation waste facility in Chatham Wake. Which, as you know, is still not approved. I don't know what, and taxpayers have paid I think, eighty to a hundred million dollars for it already.

And I don't want this kind of thing to repeat itself every time something comes up with nuclear power. In fact, when the Ragin' Grannies sang, the citizen pay, she is right. That's how we pay, when nothing happens, because of various delays. So that's why I'm speaking.

I think this license, the method of storage is very reasonable, makes a lot of sense to me, based on past performance in the record, and I don't want things to happen with tens of millions, hundreds of millions of dollars being spent by the taxpayers, and nothing resulting from it to benefit anyone.

JUDGE BOLLWERK: All right, thank you, Sir, for coming and making your presentation before us this evening. All right, the next speaker we have is Cassie H. Wasko, W -A - S - K - O. Did I pronounce it correctly?

MS. WASKO: And I do have some prepared remarks, but I don't think they'll do the gentleman much good. And I hope you'll pardon me if I'm a little disjointed, because I've been making notes.

JUDGE BOLLWERK: All right. Before you start, could I ask you to do one thing, take that silver mike and put it up in front of you. I want to be sure we get your remarks.

MS. WASKO: I am, first of all, Gentlemen, I'd like to thank you for allowing us to come here and speak tonight. It's a wonderful opportunity. I'm Cassie Horton Wasko, and I also want people to know I'm here as an individual. I'm Mayor Pro tem of Pittsboro, and I run a human services agency in Chatham County. But I'm not here representing either of those groups. I'm here representing myself.

I'm fourth generation Chatham County, I come from a long line of community spirited people. My grandfather on one side was the publisher of the state magazine, and my grandfather on the other side was Lieutenant Governor of this great state. Both my father and my uncle served terms in the Legislature. And I have worked for my community for the better part of my life.

I think that we are wasting our time when we take pot shots at each other. Every person in this room has the right to live safely and comfortably. And whether it's Orange County, or Chatham County, or wherever, but I don't

think we're getting anywhere by trying to sway you all by our emotional pleas, because I think you all are probably above that.

I was also here when Jordan Lake became a reality. And there was much hurrah and much effort made to keep that lake from becoming a reality. And there were lots of people who said it would not work out well for the community, and it did in fact take farmland. Some of the richest farmland that our county had. But it is there. And I think that we have heard a lot about the possibility of what I would call conspiracy on the part of CP&L. And I think that is clearly erroneous, as well.

I think possibly, somebody could take what has been happening around these spent fuel rods, and make another "X-Files" our of it. It is so, there is so much fiction there. I have to tell you that CP&L are good corporate citizens. I was thinking about it on my way over here this evening. I know that at one time in Chatham County, they were certainly the largest taxpayer in the county, because they used to come and get their picture taken at the newspaper, with big checks showing that they were paying their taxes.

And that was back in the days when I was working for the newspaper, and when Shearon Harris was getting ready to open, and some of the same people who are in this room

tonight, were there trying to keep Shearon Harris from opening. The opening of Shearon Harris has done a great deal for Chatham County. We have better law enforcement, we have better training for emergencies, and as I am sure you all know, we are much more at risk for having a hazardous spill from the trucks that come through the county than we are of having an accident with the nuclear power plant.

We recently had a spill of milk, and they considered that hazardous, and I haven't figured that one out yet. But at any rate, I don't presume to be an expert. I cannot stand here and tell you what is safe and what is not safe. I think that is why we have the NRC, I think that's why CP&L has good scientists, and I think that is why we have these public hearings, and have an opportunity to speak. If there's somebody else out there that happens to know more than those people, I'm sure you all will find them out before you're done.

It does hurt me to hear people casting aspersions on some of the good folks at CP&L. They're family people. Whether they're in the big corporate tower in downtown Raleigh, or whether they live in Moncure, and I do hope you will notice that the people who live in New Hill, and Moncure, and Merry Oaks, they're not here complaining. They have not come to speak. They're not saying that they don't want it, and they're the folks who live the closest to it.

But CP&L is a good employer. They have operated a safe facility. They've had the steam plant down there in Moncure since I was a little girl, and you can look at me and tell that that was a pretty long time ago. And all of that has always operated safely, and I think it is because of their commitment to making sure that they're a good corporate citizen./

They do things for the schools. They work with human services, and non profit organizations they offer in kind support for people. It's just the things they do are more than commendable. And I hope you won't be swayed by emotion, or anger, or people complaining about this has happened, and that they're not satisfied with it. And that they would like to see the fuels go somewhere else. I think we will see those spent fuel rods go someplace else at some point in time, but I think we just need to be a little bit patient, and be grateful that that microwave oven with the nuclear power in it still runs.

I appreciate the opportunity to speak to you tonight. And I do want you to remember that I am pro CP&L. JUDGE BOLLWERK: Thank you very much for your comments. The next speaker is William L. Dunn, D - U - N - N.

MR. DUNN: Good evening. And thank you for giving me this opportunity to express my opinions. My name is

William L. Dunn. I live with my wife and two daughters in Durham, North Carolina. I am President of a research fir, there, which is also located in Durham. Although I have a Ph.D. in nuclear engineering, and I worked for CP&L for about years over twenty years ago, in the early 1970's, I do not specialize in nuclear power, and I speak here as a citizen, not as an expert, nor as a representative of any group.

I come to speak, I hope rationally but firmly, in favor of CP&L's request for a license amendment, on three bases: Environment, costs, and global competitiveness. I will also make a few points about real and perceived radiation risks.

Number one, environment. Nuclear power is a relatively clean energy source. When all factors are taken into consideration, less risk to the public and less damage to the environment is caused by nuclear power than by competing fossil-fuel sources of power.

If we as a society with to enjoy the unquestioned benefits of a national electric infrastructure, we must realize the necessity for large scale means of production. IF we require large scale means of production, nuclear power must be a part of the production infrastructure.

I would prefer that CP&L be granted its request for spent fuel storage at the Shearon Harris site, in order

to keep the nuclear option viable in the Carolinas, than to suffer the risks to health and environment that would be caused by increased reliance on fossil fuel production in the region.

Number two, Cost. Despite the costs incurred by complying with intense regulation, nuclear power is still the most economic way to supply base power to the electric grid. Nuclear power should remain of the several energy sources until a better alternative is developed.

If we significantly reduce the nuclear component, then all of us, individuals, manufacturers, retailers, government, etc., will pay more for our electric power.

Number three, global competitiveness. If our electric rates increase across the board because the nuclear option is forfeited due to short sighted scare tactics by opponent, our products will cost more, and our economy will suffer.

As a citizen, and especially as a parent, I want our country to remain an industrial and economic leader. And this requires that we not put ourselves at an unnecessary disadvantage with respect to other countries, such as japan and France, who employ nuclear power.

Now, I wish to say a few words about radiation risks. passion on a given side, does not in itself make an argument correct. Just because proponents of a given

argument are loud, and even if they are well meaning, that does mean that they are necessarily right. It is ludicrous to avoid all uses of radiation.

There is an unmistakable reliance on radiation in the form of sunlight. But the argument goes further. Even ionizing radiation is beneficial, perhaps crucial to our existence. Over forty percent of all cancer treatments in the United States involve the use of radiation. My own father was spared for some time the ravages of lung cancer by radiation treatment. It is quite possible that ionizing radiation was involved in the very formation of life itself on earth. My conclusion, however, is not that radiation should be used as much as possible, but that not all use of radiation should be opposed.

You, as experts, should evaluate CP&L's request on its merits. And please realize that there is a large but unfortunately, not very vocal community of educated and rational citizens in the Research Triangle Park area who support the use of nuclear power. Thank you.

JUDGE BOLLWERK: All right, thank you, Sir, for your comments. The next speaker is Elizabeth McLaughlin, M - C - L - A - U - G - H - L - I - N.

MS. MCLAUGHLIN: Hi, I'm Elizabeth McLaughlin. just wanted to make a comment on the comments we've heard tonight about emotion and passion, not signaling rational

thoughts, and being something that should be silenced, and I would just warn you all that the passion and the motion that's driving the very rational thought, and the very calm and intuitive, inductive thinking that's gone on in this community around this issue will in the end resolve whether or not Shearon Harris is allowed to expand its waste facility. Because we're not going to stop after these hearings are finished. We are not going to stop until the license is denied.

The other point that I wanted to raise is that the bad faith of CP&L is evidence that there is no bad faith then, they've unfortunately supplied us with belief that there's some bad faith because they've refused to answer questions that Orange County hired capable scientists to raise and study earlier on in this process. And they have repeatedly refused to answer the questions that were raised by those scientific experts around the safety issues of this proposal.

So we will just again call on them to address those findings and give us some sort of response. I thank you all for listening, and again, I would just remind you that the people in this room, the citizens that oppose the granting of this license are not going to go away. Thank you.

JUDGE BOLLWERK: Thank you for coming to speak

with us tonight. The next speaker is listed as Sandra Marlow, M - A - R - L - O - W.

VOICE FROM AUDIENCE: May I speak for a second time?

JUDGE BOLLWERK: If you don't mind, could we take some folks that we haven't heard from, and then we'll come back to you, if that's acceptable to you? All right. We'll put you sort of hold, and then we'll come back. The next speaker is Rachel Elliott, E-L-L-I-O-T-T? All right, we'll come back to them as well. We'll try their name again. The next speaker, Allen B. MacIntyre, M - A - C - I - N - T - Y - R - E? Mr. MacIntyre?

MR. MACINTYRE: Well, I feel a bit out of place here, because I don't consider myself an entertainer, or any of these other things, or writer, or any of those things.

I hope that your group will not be overly swayed by the emotionalism we've seen here. But meeting in Chapel Hill, you do risk that. I do recall the cesspool of Jordan Lake. We'd laid I believe about twenty years on that one.

But what I'm here for is to suggest that I haven't heard very much to justify all of this apprehension, because it strikes me that there isn't a great deal of difference between the expanded method of storage and the existing method of storage, which has run for some time.

First, I will say I'm an older electrical

engineer. My father was an electrical engineer, my claim to fame might be that Eugene Denton who calmed down Three Mile Island for you people, was in North Carolina State University the same time I was; he was a little older than I was.

 But I think we're seeing so much emotion going this, and I do hope the meeting is getting the facts that they need. I certainly, all I've seen here tonight, and the previous, very attractive speaker, says no matter what you are told, we're going to continue to fight. Facts have nothing apparently to do, and I do hope you're getting the fights, and the facts, and can reach a reasonable decision on this. Thank you.

JUDGE BOLLWERK: Thank you, Sir, for coming this evening to speak with us. The next speaker would be James Willeford, W - I - L - E - F - O - R - D.

 $$\operatorname{MR}.$$ WILEFORD: Hello, thank you for letting me come up. Well, I thought you were quite factual. We'll start off that way.

I'm a high school counselor in Raleigh, North Carolina. I'm here with my wife and child, and we're here to express our opposition to CP&L's plan. And I'd also like to say that many of my students, I teach in social studies classes at the high school there, are also following this issue at this point. And they're watching the democratic

process, or the lack thereof, and that's basically what we're focusing on, and will continue to do.

And I just want to say that we're going to be there. Where ever this goes, and whenever it goes. We're not going to forget about it. Awareness is increasing, and it's going to grow, because we're going to make it grow. Thank you very much.

JUDGE BOLLWERK: Thank you very much for coming to speak with us this evening. The next speaker will be P. J. Disclafani, I'm sure I'm mispronouncing it, D - I - S - C - L - A - F - A - N - I. Was that close enough?

 $$\operatorname{MR}.\ DISCLAFANI:\ Pretty\ close.\ I'm\ a\ student\ at$ the University of North Carolina here in Chapel Hill.

I heard that you were coming, but you weren't officially listening to what people have to say. I don't really know what that means, but I hope that it's not true. Because there are a lot of other students and a lot of citizens and local governments around the area that are concerned about CP&L's plans to expand their waste storage capacity. And they're concerned about the findings of reputable scientists who have identified a real potential for an accident.

And I just want to say that we plan to fight to block the CP&L's planned expansion. Which isn't just a request to store nuclear waste, but it's effectively a plan

to make Shearon Harris the largest nuclear waste dump in the country. And nobody can attest to the safety to that, because it's unprecedented.

I hope that you'll find that this proposal by CP&L warrants an open process, because it affects the lives of many people whose legitimate concerns deserve to be heard. And because real risks have been identified. So I hope that you will give full consideration to all the facts and find that there should be an open process. Thank you.

JUDGE BOLLWERK: Thank you for coming this evening, to speak to us. Let me see again, if Seth and Rachel Elliott are here. All right, why don't we at this point go ahead and take a break. Probably around five minutes. Let me mention again, there is a sign up sheet over in the corner. If you wish to speak and have not signed up, you need to do so. That's how we'll know to put you on as one of the speakers. But again, let's take about five minutes.

(Off the Record.)

 JUDGE BOLLWERK: All right, let me go back and check again for Seth and Rachel Elliot, E - L - L - I - O - T, are they not here, or not - - all right. The next speaker we have is Monica Mulhern, M - U - L - H - E - R - N

MS. MULHERN: Hi, I've been an anti nuclear

activist for many years, beginning back in the seventies. I come from Philadelphia, Pennsylvania, so I was very aware of what was going on after the Three Mile Island nuclear accident. And there was a lot of scary things that happened, that didn't get reported by the media. And I had a cottage in the country, and there were farmers who were unable to sell their milk for an entire year. And there were terrible deformities in the young born to the cows. And I'm sure some of that is common knowledge.

One of the biggest concerns of many, many, many concerns that I have regarding nuclear power is that none of the fail safes are adequate to contain spent fuel, or radiation in any of its forms. For hundreds of thousands of years. So given that, as a reality, I don't see how anybody can move forward with it at all, much less to expand an existing plant.

The stockpile of nuclear waste is mounting, and there is nowhere to put it that can be guaranteed safe, period. End of story. No matter what else you want to say on the pros and cons, we cannot assure our children and their children and our children's children as the Native Americans would say, for seven generations, we cannot promise them that what we store in these pools, what we bury, what we mine, however we release it, or however we seek to contain it, humans are not perfect, and science has

proven itself to be wrong, time and time again.

Chernobyl, Three Mile Island, the Challenger explosion. No matter how smart we get, there is always the possibility for error. And when the risks involve a hundred mile radius of a highly populated area, and if there is just one minuscule chance that that radiation can leak, then why is anybody is even considering it? And I think the place should be closed.

JUDGE BOLLWERK: Thank you for your comments. The next speaker is Mike Schiller, S - C - H - I - L - E - R

MR. SCHILLER: Hi, how are you doing. Thanks for letting me speak tonight. My name is Mike Schiller, I live in Chatham County. And I just want to state that I'm opposed to CP&L's proposal to expand the nuclear, storage of nuclear waste on site at their plant.

Some of the reasons being, the storage of the waste in these pools; the pools, somehow they've misplaced the documentation of the pools that they're proposing to put into service. And just a note here. I moved into Chatham County about six years ago. I bought a house in Chatham County. And the waste disposal system in my house, the septic system, the documentation was missing on it. And that had to be found before we could move into the house.

And that's a system that would just affect a very

few people if it were to fail. This is a system that, if it were to fail, would affect hundreds of thousands of people if y you go with a hundred mile radius. And I was not allowed to move into my house. The documentation was found, but without that documentation, I would not even be allowed to move into my house.

So I feel that the fact that the documentation is not available for the plumbing systems, and the pools that they're proposing to put into service seems irresponsible for something so toxic, so potentially toxic as nuclear waste.

Also, they're proposing to store this waste. I know this waste is a big problem in the country. Some of the permanent sites have not been approved that are supposed to go into service recently. The waste is backing up, and I know this is a problem, but that means that this waste is going to be stored closer and closer together with neutron absorbing material between the rods, and so forth. The cooling systems to keep the water cool. These are systems that need to keep working.

Systems that have plumbing, and so forth. Things that can go wrong, and CP&L initially these four pools were designed to have two cooling systems dedicated to them, and CP&L is not proposing at this point in time, they only have one cooling system for the pools they have in service.

And with these additional pools added, they still not, they don't have a plan on the books right now for another cooling system. So this also to me seems irresponsible for something as sensitive, again as nuclear waste. I feel that any precautions, additional precautions you can take to make the system a more safer one, are steps that should be taken. Its' just too sensitive, nuclear waste is just too sensitive a thing not to take those extra steps.

There are also alternatives to storing the waste in pools where you have to have systems that have to keep working in order for the waste to remain safe. You can put the rods in dry cask storage, for instance, that doesn't require plumbing. It doesn't require systems to keep working, in order for this waste to remain safe. And you can, maybe it requires a little more expense, maybe the waste has to be stored a little farther apart, and so forth.

But again, in the interest of safety, if we're really, truly interested in making this stuff as safe as possible, it just to me it makes sense. Something like nuclear waste, again. And you can say that there really hasn't been these storage, a major storage accident. Most of the accidents we know of have been in the reactors themselves. Nuclear accidents like Three Mile Island and Chernobyl.

But I really don't believe that just because we have a good record in this area in the past doesn't necessarily means it's going to be that way in the future. When you sign up for your, put money in a money market account, they say past performance is no indication of future performance. So I really believe that this is a bit of a gamble also.

The more we put, the more the system backs up, with the absence of permanent storage facility, the more tightly the waste is packed together, the risks are going to increase. There is no arguing that point. The more waste is put, the more waste has to be handled in the pools, and so forth, the more tightly it's packed together, the more of it there is in the pools, you can't argue with the fact that the risk goes up. I just can't see that argument, so those are some of the main points I'd like to make.

And I feel like the NRC is here to protect to put in place as part of its charter to protect citizens such as myself and my family, and so forth. And I feel like in these situations, the safest alternative should be chose any time they can be. Anyway, those are the main points I'd like to make. Thanks for letting me speak tonight.

JUDGE BOLLWERK: Thank you for coming to speak with us tonight. The next speaker is Rita Dealy, D - E - A - L - Y.

MS. DEALY: Thank you for providing me this opportunity. I'd just like to say I was a student at Penn State University when TMI happened. And I was within the hundred mile radius. And not having an evacuation procedure, no one knew what to do. Fifteen to twenty thousand students, so very much aware that nuclear accidents happen.

I would also like to say that I'm disgusted with CP&L, the process, their reluctance to have an open process, denying me my opportunity an a concerned citizen to have all the facts to make my decisions for supporting the expansion or not. And I'm not supporting expansion because I feel that I don't have the information that I need to make that decision.

Lastly, I feel as a citizen of Upper North Carolina, that if there is a safer option, that we deserve that safer option. And I hope the NRC will provide us that safer option. Thank you.

JUDGE BOLLWERK: Thank you very much for your comments. The next speaker is Madeline Morreale. I'm sure I'm mispronouncing that. M - O - R - R - E - A - L - E.

MS. MORREALE: Morreale.

JUDGE BOLLWERK: Morreale. I'm sorry.

MS. MORREALE: Good evening. My name is Madeline Morreale. I'm a resident of Chatham County, and I came here

tonight to listen and to learn, and up to this point anyway, I haven't been on anyone's mailing list. I'm just here as a concerned citizen. I've been interested in the remarks that have been made so far, and it seems to me that the question tonight is not are the folks at CP&L good citizens? And the question is not are we opposed to or supporting nuclear power in general? But instead I think the question is do we support or oppose CP&L's request to amend its storage plans.

For those who do not draw a paycheck that supports a career in nuclear safety, it's difficult to know whether the proposed plan is safe. And for those of us who aren't professionally trained in economics, it's difficult to know how to weigh the costs and benefits of the proposed plan against alternatives. We've been admonished a couple of times this evening to leave emotionalism and passions aside for rationalism and facts. And I promise to leave here tonight committed to learn more about both of those.

But given the fact that the current process has permitted CP&L to proceed without making available the company's analyses for public scrutiny, we have little to rely on than our own instincts. And those aren't strong enough for me to be reassured by the company's promises of safety.

So let me just conclude by restating my opposition to the proposal to date. My request that the NRC consider a

more open process, and wishing as the previous speaker did safer alternatives be considered. Thank you.

JUDGE BOLLWERK: Thank you for your comments. The next speaker is Verla Linsko, L - I - N - S - K - O.

MS. LINSKO: Thank you. My name is Ferla Linsko, I'm a resident of Chapel Hill. I've live here in Chapel Hill since 1965. I'm currently a state legislator, and I've also served on a local board of education, and on a board of county commissioners.

I'm here primarily to request that you hold a formal public hearing where oral arguments can be made. I'm not a scientist, and I can't stand here and argue the scientific facts. But I can tell you that the public is increasingly disenfranchised. They feel increasingly isolated from their government. They feel increasingly cynical about their ability to have input into their government.

I think some important questions have been raised that haven't been answered formally. And I think you have the power to help us here in this area to feel that the citizens have had full opportunity for input.

And a bit of comment I'd like to make is that I think the passion of American people is very important to our democratic form of society. I'm glad that we had passion around the Boston Tea Party. I'm glad that

Elizabeth Katy Stanton and Susan B. Anthony felt passionate about their cause. So I think that plays an important role here, and I appreciate the opportunity to let me speak.

JUDGE BOLLWERK: Thank you for coming to speak with us tonight. Let me go back in my list. Seth and Rachel Elliott? The Elliot's still not here, or left?

All right, at this point, I've come to the end of the list that I have, other than Ms. Marlowe, which I have not forgotten. Let's go ahead again and take a five minute break, and see if we have anyone else who wants to sign up at this point. Again the list over there, if you have not signed up yet, I would appreciate it very much. If you want to speak, put your name on the list.

We'll take another five minute break and come back, and if we haven't had any more signatures, then we'll hear from Ms. Marlowe.

(Off the Record.)

JUDGE BOLLWERK: Let me check one more time about the Elliot's. I think they may have left the building as the saying goes. We have a couple of new speakers that have not spoken before, and it appears to be two individuals we have heard from before, we will take. Craig Hammond, H - A - M - M - O - N - D.

MR. HAMMOND: Thank you for letting me speak. I'd like to say that I've lived and worked in Durham and Orange

counties for about fifteen years, in construction trades, and I have two sons one in middle school, one in high school. And I'd just like to add my voice to that of other people who've spoken before, and emphasize the fact that what we're sensitive to is the truth.

It's what we go to Church to understand. It's what we gather in small groups and large groups to emphasize with our children and with our friends. It's what we read our Bibles to understand. And I feel that this is maybe a large example of truth in action, as it's reflected in your actions, and in our actions as people.

I think there's a larger reality working here. It maybe goes beyond human understanding, and I feel like it's a time for all of us to look inside ourselves and to try to bring the best of ourselves forward. Because we're talking about the health of ourselves, and our children, and their children. And not only that, but the honor, and the soul and the way it moves, and the way that we show who and what we are in the decisions that we make.

This may sound a little bit out there so to speak, but I think it's definitely a time for understanding, and some soulful self examination. There's things more important than money, and I think it's a good time to bring that to the forefront. To make sure we make some decisions that we can stand by in our hearts, and our minds, and our

souls, for future generations.

JUDGE BOLLWERK: Thank you, Sir, for speaking with us tonight. The next individual, Steve Fishman, F - I - S - H - M - A - N.

MR. FISHMAN: Hi. My name's Steve Fishman. I live in Chatham County. I've lived there for the last five years. I plan on raising my family and making my life there.

And someone told me on the way in here, that this hearing really has no bearing, no bearing on what I guess eventually will be a decision. And when I heard that, I was quite surprised, and I guess one of the things I want to ask is, is that true? I mean, how does this - - well, there's an answer I guess.

I guess that's one question I have, and I didn't really want to believe that that was true. And I don't know if it is or not. There's not an answer here. But I just want to, I guess I just want to say that if it's if it is true, that I find it reprehensible that there's any faction in our community, including the good corporate of CP&L. That would put profit ahead of risk to our community.

We're asking for an open process with them, not back room Bastille. That's what I have to say. Thank you.

JUDGE BOLLWERK: I thank you, Sir, for coming this evening. All right, we have two additional speakers listed.

And both of whom I think the Board has heard from before. Mrs. Marlow, M - A - R - L - O - W.

 MS. MARLOW: I asked to speak again. I spoke from the heart this afternoon. I want to speak from my head this evening. I am a professional librarian. And as such, I have been working on research. I am published in the Bulletin of Atomic Scientists. And Library Journal article called "Suppression of Nuclear Information." And it was that kind of revelation that made me concerned about secrecy in government in a democracy and the extreme need for your commission and CP&L to allow the public the right to a public hearing.

This is a difficult week, because it's exam week. So many of the people who are intellectuals in the community of Chapel Hill are not able to present and listen, and hear, and understand.

I'm going to read, very quickly an article by one of the former professors here from Chapel Hill, Charles Van Cleve from the School of Medicine. He wrote a book called "Late Sematic Effects of Ionizing Radiation." It's published by the Division of Technical Information by the AEC. And he talks about NATO irradiation. "Gross abnormalities at birth are called congenital malformations. They occur spontaneously in all animals including man. They can be produced in experimental animals by suitable

intrinsic or extrinsic agents. Ionizing radiation is one of the most potential psycho chemical tetrogens."

We're not talking about a car driven by a person when we're talk about risk in legalese. Risk acceptable or unacceptable, or permissible requires accountability and responsibility. And those of you on the commission and those in the law firm know that this industry has more laws that prevent any legal rights to the citizens of this country. So that if my child or my grandchildren were struck by a car, I could file a lawsuit to understand why the car hit my child. But if there was an accident at any nuclear plant I would not be able as a citizen to find a lawyer to represent me believe to file a claim against the company or corporation, or electronics company that runs that plant, or this commission.

Risk means that the people that forced that risk on the citizens of this country also should be accountable for the risk. And I was going to ask some questions about TMI, but there's too many other things that have happened here. Because Three Mile Island, there was a lot of behind the scenes bargaining in the effects after TMI. I know that because I know some of the researchers involved and the people from TMI.

I also am aware that Roselee Burtell has recently published some information about cover up of information

regarding Three Mile Island. We don't need cover up. And we don't need disagreement. Unless we are allowed to have a public hearing to really hear the issues from all sides. When people talk from their hearts with passion, they are talking as American citizens. Right or wrongly.

And there's a root to that word that makes a difference between what we call a democracy, and what we call a Fascist state. And that word, which is what I think all forms of government need, is compassion. And I'm asking that from this committee, this commission to have a public hearing. I worked as a librarian at an institution for feebleminded youth in Massachusetts. And while I was there, I discovered documents that dealt with research in the 1950's using radioactive isotopes on children who were mentally retarded. And there were hearings in the United States, and they were quietly made public.

I also worked previously at a prison in Massachusetts, and I will tell you that the people I worked with, I set up the law library there. The inmates who were doing time for murder, for rape, for theft of company time, they did not show any concern when they heard the passionate cries of their victims. Bear that in mind when you think about our request for a hearing. Thank you.

JUDGE BOLLWERK: Thank you for speaking with us again. Additional speaker, Mark Marcopolus, am I

pronouncing that correctly? You spoke yesterday in Raleigh, is that correct, Sir?

VOICE FROM AUDIENCE: Mr. Eddleman would like to clarify something he said earlier.

JUDGE BOLLWERK: Sure, Mr. Eddleman, would you like to come up briefly?

MR. EDDLEMAN: It's kind of embarrassing, even to prove my point about mistakes, but I left something out of my presentation. It will only take a few sentences to include it. Thank you very much.

This has to do with the heat load calculations. The heat load calculations for heat removal from the pools at Harris that CP&L was submitting to the NRC all through 1998 show them short about fifteen million BTU's per hour. And all of a sudden, after everything was closed out, they have a much larger of heat removal capacity claimed.

And what I left out was to say that if these calculations of the original heat load estimate were made in accordance with the standards of care that people have been saying, are standard to the nuclear industry and certainly ought to be, then how could they have made such an enormous error all those millions of BTU's?

But if indeed the change is result for something other than error, that cries out even more for a thorough inquiry. And unless the calculations the differences, the

floor basis are made public in every detail, it's going to be very difficult to trust the process that's going on here. When CP&L gets to decide what to conceal and what to reveal we all lose.

JUDGE BOLLWERK: All right, thank you again, Sir. Mr. Marcoplos, M - A - R - C - O - P - L - O - S.

MR. MARCOPLOS: Many people have taken off work, taken time out of their schedule taken time away from their families to come down here both here and in Raleigh to speak to you all. Not sure exactly what was meant by it's a hearing, you can't take into consideration what's said, but yet you're going to consider what's said. A lot of people decided well, it's important enough to go down and at least talk. And I have a suggestion. We're at the end of the two days, the many hours of talk from our side of the podium.

I think it would be very respectful of other people that came to speak if you all would each just take a few minutes yourselves, and tell us what your reaction is to hearing us, out here in this part of the country. Speak to you about this. We'd really appreciate just a few minutes before you leave and then go home. Would you be willing to do that for us?

 $\mbox{\tt JUDGE}$ BOLLWERK: It's up to the other Board members.

JUDGE LAM: Let the Chairman speak first.

JUDGE BOLLWERK: It's obvious to me there's many heartfelt feelings on both sides of this issue. People are very concerned. Both in opposition, and in favor of what CP&L wishes to do. That's my basic statement about what I've heard these several days. That's not going into details, obviously, but that's the general impression I've come away with. There's considerable concern here among the populace on both sides of this issue.

Judge Lam, do you want to say anything? JUDGE LAM: I guess I'd like to add to Judge Bollwerk's comment. First, I appreciate being here, and listening to all your statements. I consider your participation an important part of our process. Each word that has spoken here has been transcribed, and will be made available to each member of this Panel. As an official transcript. Furthermore, your statement will now become a part of our official docket. That much said, and I for one will certainly consider every word that is spoken here. Let all the facts be known, let all the interpretations be made, and let us make the best decision that we can. We have no other agenda other than protection of public health and safety. If this is not our agenda, none of us would be here. You have that assurance. The safety of the public, it's of utmost concern so let all the facts be known, let the proceedings move forward, and I certainly have listened

attentively to every word that has been said, and I will read the record again. And I do want to thank you for being here.

JUDGE BOLLWERK: Judge Shon?

JUDGE SHON: I want to say that I too, have listened very attentively.

 $\mbox{\sc COURT}$ REPORTER: Your Honor, would you put the mike over.

JUDGE SHON: I've listened attentively, and I've been impressed by the articulateness of the people who have spoken here. And by their obvious commitment to public health and safety. We too are committed to public health and safety. That's our job. We have listened now, and I am certain that the background that you people have given us is going to be worthwhile to us in any further proceedings that may occur here. It is not a portion of the record, as you've been told, on which we can firmly ground any decision. But it is certainly something that will give us the kind of mind cast that will ultimately affect how we think about it. And I want to thank you all for having come here, and having given us your views.

JUDGE BOLLWERK: Thanks for responding. I'd like to add that it's a very simple step from your concern that you're showing here, and your attentiveness to take that one baby step toward requiring that the information that we have

been calling for the past year be released by CP&L. That is economic information, the money they're going to save by using this plan, rather than the dry cask storage, and the issue of Lochbaum and Thompson's concerns. I personally feel after hearing you speak that if you truly feel that you have just that you felt, that you will find a way to use your power make that information available to us. Thank you very much.

SPEAKER: Just before you go, you've mentioned again Dr. Thompson, and Mr. Lochbaum. I might point out that it is in large measure because of the concerns of Dr. Thompson and Mr. Lochbaum that we have admitted Orange County to this proceeding, and we certainly have heard much of what they have to say, and we certainly anticipate that we will hear more in greater detail.

MR. MARCOPLOS: That's very good, and what I'm trying to articulate is that the Citizens need to hear CP&L's response to this. We live here. In a democracy, we are entitled to that information. That is what has been missing, and I feel like you could commit to that if you so chose in making that happen for us, so, thanks a lot.

JUDGE BOLLWERK: All right. Thank you, Sir. At this point, it's 9:15. Is there anyone else here who wishes to speak, or say anything further? All right. We had in our itenarary indicated we would be here till 9:30. I think

at this point if there appears to be no one else in the audience who is interested in speaking, we will go ahead and adjourn.

Let me just say again, as my two colleagues have indicated, our sincere appreciation to everyone that took the time took the effort over the past four days, to come away from your work, or their home, you all have other things obviously. To come out and give us your views on this proceeding, and what you believe about the CP&L request. I would again like to thank Orange County for making this facility available. This is the second time and we very much appreciate this marvelous facility for these types of events, and thank you very much.

MS. BROWN: I would just like to say, on behalf of the County Commissioners, that we are very glad that you are here to listen to our citizens.

JUDGE BOLLWERK: Thank you very much. Again, as Judge Lam has mentioned,

these proceedings have been transcribed. And will be part of the docket of these proceedings, and available for the Board members and the parties, and frankly, for the public, if they wish to look through them and review them again. At this point that wishes to say anything further, I'm going to adjourn these proceedings, and again, thank you all for coming tonight. Thank you.
