**Key Elements of Integrated Nuclear  
Fuel Cycle Management Strategy**

---

- **Safety**
- **Non-proliferation**
- **Waste management**
- **Resource utilization**
- **Economics**

**Fuel Cycle Options – *How & When?***

---

- **Several options for the future nuclear fuel cycle**
  - Existing "once-through" fuel cycle
  - Other open or closed fuel cycle alternatives
- **We have flexibility on "*How*"**
  - Status quo
  - Evolutionary approach
  - Revolutionary approach
- **We have flexibility on "*When*"**
  - Near-term, leveraging current technologies and existing reactor fleet
  - Longer-term using "next-generation" technologies
- **AFCI focus has shifted from accelerated deployment of recycling facilities to a long-term, science-based R&D program**

### Leveraging DOE Capabilities to Create Transformational Technologies

- New design tools enabled by modern high-performance computing
- Advanced separations techniques and reactor technologies
- Improved fuel performance and fabrication techniques
- Enhanced safeguards to control and protect nuclear materials
- Robust waste forms tailored to the disposal geology

Science-based R&D to create options for a sustainable fuel cycle

U.S. DEPARTMENT OF **ENERGY**  
Nuclear Energy

### Nonproliferation Objectives

- Prevent diversion/misuse of nuclear material
  - Combination of intrinsic and extrinsic factors
- Improve safeguards technologies and methods
  - Advanced instrumentation/real-time process monitoring
  - Safeguards by design
- Reduce plutonium stockpiles
  - No separated plutonium
- Limit the spread of enrichment and reprocessing technologies
  - Comprehensive fuel services

Protecting nuclear facilities requires all the security features to come together and work as one.

There is no single technological solution to ensure the peaceful use of nuclear energy – a robust system of safeguards and security is required.

### Waste Management

- Closed fuel cycle options provide opportunities for improved waste management
  - Does not eliminate the need for a geologic repository
  - Interim storage must be part of the near-term solution
- Used fuel recycling can reduce the radiotoxicity, heat and volume of nuclear waste byproducts
- Recycling will generate large volumes of low level waste
  - management challenges are different
- Any future fuel cycle option must safely and effectively deal with nuclear waste

## Uranium Resources

- Under some nuclear energy growth scenarios, uranium resource demand exceeds supply during this century
- Estimates of uranium availability have grown with nuclear use
- Investment in uranium exploration has increased as the price has gone up
- Future impact of uranium supply is far from certain
  - It pays to have options

Nuclear Energy

## Cost

- A transition to a closed fuel cycle would be expensive and take several decades
  - a commercial scale reprocessing plant could cost >\$15 billion
- Business case for an integrated fuel management approach
  - Industry estimated that a waste fee between 1 – 3 mils/kWh would be needed
- R&D and innovative technology could significantly reduce costs
  - Simplified/compact systems, advanced materials
  - Improved design processes, reduced conservatism

## Path Forward

- Establish long-term, science-based fuel cycle R&D program
  - Pursue breakthrough technologies to address fuel cycle challenges
    - Separations, fuels/targets, fast reactor recycling, waste forms
    - Safety, safeguards, waste management and cost
    - Integrate theory, experimentation and advanced modeling
  - Engage end-users and key stakeholders to inform the R&D effort
- Continue to evaluate a broad suite of fuel cycle options
  - Comprehensive systems analysis studies to evaluate options and explore deployment alternatives and implications
- Continue to pursue international collaboration with fuel cycle nations to leverage expertise and resources
  - Multi-national forums (e.g., Generation IV International Forum – GIF)
  - Bi-lateral and multi-lateral R&D agreements

---

---

---

**Conclusion**

- Nuclear power is poised to grow in the U.S., but there are uncertainties
- The U.S. fuel cycle management strategy must contain options to provide the flexibility we know we will need
- Uncertainty over the long-term supply of uranium makes it prudent to develop technically viable alternatives
- Innovative, science-driven R&D will enable the safe, secure, economic and sustainable expansion of nuclear energy
