---

---

### What does *reverse engineering* mean to you?

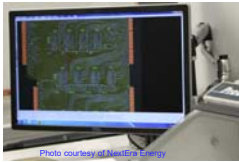

Photo courtesy of NextEra Energy

- Different “tiers” exist
  - Items manufactured to industry specifications and standards
  - Simple items, straightforward design requirements
  - Complex items and assemblies

---

---

---

---

---

---

---

---

### Currently Available Guidance

- Available Guidance
  - EPRI TR-107372, Guideline for Reverse Engineering at Nuclear Power Plants
  - EPRI 1008254, Engineering Change Optimization
  - EPRI 1008256, Technical Evaluation of Replacement Items

Guideline for Reverse Engineering at Nuclear Power Plants

1998

Plant Support Engineering Guidelines for Optimizing the Engineering Change Process for Nuclear Power Plants, Revision 2

R1-1998  
R2-2007

Plant Support Engineering Guidelines for the Technical Evaluation of Replacement Items in Nuclear Power Plants

R0-1989  
R1-2006

---

---

---

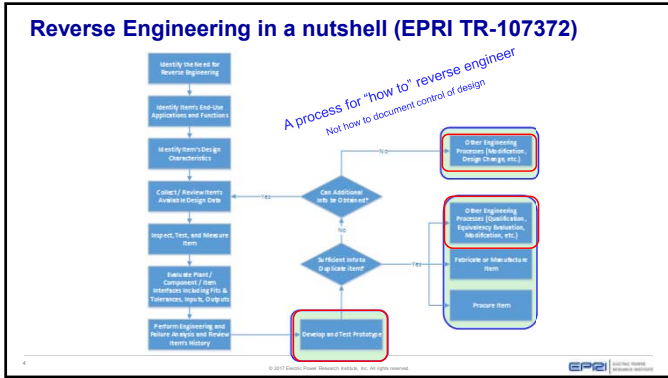

---

---

---

---

- ### Impetus for Reverse Engineering Guidance Revision
- U.S. NRC IN 2016-09, Recent Issues Identified When Using Reverse Engineering Techniques in the Procurement of Safety-Related Components
  - RE Guidance addresses "how to" reverse engineer from a licensee's perspective
  - Design control is not inherent in all reverse engineering activities / techniques
  - Additional guidance on how suppliers or licensees **control design when using a reverse engineered item** will be beneficial to the industry
  - Incorporate lessons learned by suppliers and licensees that have employed reverse engineering techniques
- 5 © 2017 Electric Power Research Institute, Inc. All rights reserved. EPRI

---

---

---

---

---

---

---

---

---

---

---

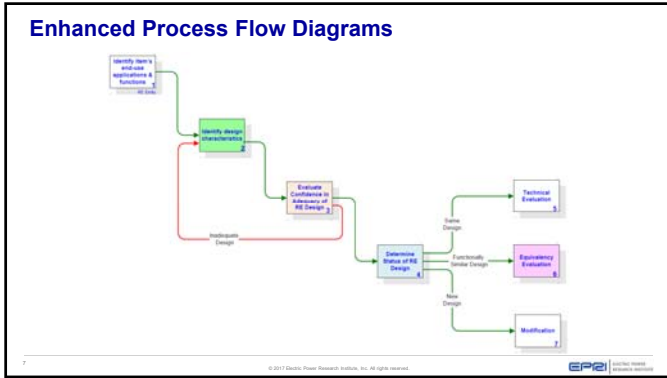

---

---

---

---

### Additional Process Guidance / Detail

- Develop sufficient understanding of design requirements
  - Collect available design information
  - Consider application/plant specific requirements
  - Consider functional design requirements
  - Consider what may not be known
- Plant design, component design, and “below level of detail” design considerations

8

---

---

---

---

---

---

---

---

### Additional Process Guidance / Detail

- Do not *assume* replacement item designs based on reverse engineering techniques are “equivalent” to current item design
- Determine status of items associated with use of reverse engineering techniques. Replacement items can be:
  - The same design
  - Functionally equivalent design
  - New design (requires establishing suitability of design)

---

---

---

---

---

---

---

---

**Additional Process Guidance / Detail**

- Knowledge of item functions
- Use of informed failure modes & effects analysis
- Communication between reverse engineering entity and licensee

---

---

---

---

---

---

---

---

---

---

**Additional Process Guidance / Detail**

- Addressing the limitations of physical examination
  - Items with active functions
  - Complex assemblies

Measured from Sample: 7.23  
 Tolerance based on machining process: +/- 0.25  
 RE Design Requirement / Tolerance: 6.98 - 7.48  
 We didn't know OEM Requirement / Tolerance was +/- 0.25 6.75 - 7.25  
 Could there be a problem?

**Activities that employ “reverse engineering” techniques**

Activity	Purchasing an item with known attributes or design from a different supplier	Recover characteristic information for dedication	Produce a functional / equivalent "part" (simple item)	Produce a functionally equivalent "component" (complex item)
Description	<ul style="list-style-type: none"> <li>• Capturing information about an item that is necessary to create a purchase specification</li> <li>• Examining a standard product or its specification to identify information needed to purchase it directly from a manufacturer or alternate source</li> <li>• Purchasing an item directly from a manufacturer or alternate source</li> </ul>	<ul style="list-style-type: none"> <li>• Examining a specimen to identify acceptance criteria / characteristics pertinent to the commercial grade dedication process</li> </ul>	<ul style="list-style-type: none"> <li>• Recovering information about a part so that a functionally equivalent part can be fabricated and installed in existing equipment</li> </ul>	<ul style="list-style-type: none"> <li>• Recovering information about a component so that a functionally equivalent component can be fabricated and installed in existing equipment</li> </ul>
Purpose	<ul style="list-style-type: none"> <li>• Expand supplier options, reduce cost or lead-time</li> </ul>	<ul style="list-style-type: none"> <li>• Recover information about the item's original design characteristics to help establish acceptance criteria</li> </ul>	<ul style="list-style-type: none"> <li>• Recover information about the item's original design so that a fully functional replacement can be fabricated</li> </ul>	<ul style="list-style-type: none"> <li>• Recover information about the component's original design so that a fully functional replacement can be fabricated</li> </ul>
Example	<ul style="list-style-type: none"> <li>• Recovering information about a fastener, o-ring, drive shaft so it can be purchased from a different source</li> </ul>	<ul style="list-style-type: none"> <li>• Using FTIR to determine material type</li> <li>• Examining surface finish to determine machining process used to fabricate</li> </ul>	<ul style="list-style-type: none"> <li>• Recovering dimensional and material information from an existing MCV stem nut and creating drawings so that a machine shop can create a replacement</li> </ul>	<ul style="list-style-type: none"> <li>• Recovering dimensional, material and functional information from an existing circuit card, prototyping and fabricating a replacement</li> </ul>
Conditions / Boundaries	<ul style="list-style-type: none"> <li>• Items are fabricated in accordance with standards/known design parameters</li> </ul>	<ul style="list-style-type: none"> <li>• Used for commercial grade dedication</li> </ul>	<ul style="list-style-type: none"> <li>• Item is simple in design requiring only dimensional and material of construction information</li> </ul>	<ul style="list-style-type: none"> <li>• Component is complex in design, multiple parts must interface to achieve function information</li> </ul>
Design	<ul style="list-style-type: none"> <li>• Same design</li> </ul>	<ul style="list-style-type: none"> <li>• Same design</li> </ul>	<ul style="list-style-type: none"> <li>• Functionally equivalent or new design</li> </ul>	<ul style="list-style-type: none"> <li>• Functionally equivalent or new design</li> </ul>

### Graded approach to understanding scope & complexity

Items manufactured to industry standards	Simple Items	Complex Items	
O-rings Fasteners Drive belts Discrete electronic components	Gaskets Machined parts (no active function) Thermocouple / Thermowell	Printed circuit board Machined parts (active functions)	HCU accumulator
Technical evaluation	Equivalency evaluation that documents functionally equivalent design characteristics & functions via side-by-side comparison	Equivalency evaluation that documents functionally equivalent design characteristics & functions via bounding technical requirements or a modification	Modification – establish suitability of the RE design

### Understanding Division of Responsibilities

Design Information	Examples	Customer Responsibilities	Supplier Responsibilities	Plans to market as an "aftermarket" basic component replacement
<b>Known Design</b>	<ul style="list-style-type: none"> <li>Customer provides complete design information</li> <li>Manufactured to industry standard</li> </ul>	<ul style="list-style-type: none"> <li>Customer provides complete design</li> <li>Customer maintains design control (other eval, EE or Mod)</li> </ul>	<ul style="list-style-type: none"> <li>Supplier does no design work</li> <li>Supplier manufactures to customer design</li> <li>Supplier certifies to customer design</li> </ul>	<ul style="list-style-type: none"> <li>Supplier publishes product capabilities / specifications</li> <li>Supplier verifies suitability of design for published capabilities (testing, design review, alternate calculations)</li> </ul>
<b>Unknown Design</b>	<ul style="list-style-type: none"> <li>Customer provides working / non-working sample</li> <li>Sample purchased from alternate source</li> <li>Customer provides quality and technical requirements / equipment specification</li> </ul>	<ul style="list-style-type: none"> <li>Customer verifies supplier is approved for design activities</li> <li>Design responsibility is addressed in the purchase order</li> <li>Customer E engineering approves design</li> <li>Customer maintains design control (EE or Mod)</li> </ul>	<ul style="list-style-type: none"> <li>Supplier recovers design information</li> <li>Supplier verifies suitability of design for identified functions (testing, design review, alternate calculations)</li> <li>Supplier submits design to customer for approval</li> <li>Design responsibility is addressed in certification</li> </ul>	<ul style="list-style-type: none"> <li>Same as above</li> </ul>
