1	P-R-O-C-E-E-D-I-N-G-S
2	8:30 a.m.
3	CHAIRMAN BONACA: The meeting will now
4	come to order. This is the third day of the 506th
5	meeting of the Advisory Committee on Reactor
6	Safeguards. During today's meeting, the Committee
7	will consider the following: Draft final revision to
8	Regulatory Guide 1.168; verification, validation,
9	review and audits for digital computer software used
10	in safety systems of nuclear power plants;
11	Subcommittee report on reactor fuels; future ACRS
12	activities and report to the Planning and Procedures
13	Subcommittee; reconciliation of ACRS comments and
14	recommendations; proposed ACRS reports.
15	A portion of this meeting will be closed
16	to discuss a proposed ACRS report on safeguards and
17	security. This meeting is being conducted in
18	accordance with the provisions of the Federal Advisory
19	Committee Act. Mr. Sam Duraiswami is the Designated
20	Federal Official for the initial portion of the
21	meeting. We have received no written comments or
22	requests for time to make oral statements from members
23	of the public regarding today's sessions. A
24	transcript of portions of the meeting is being kept
25	and it is requested that speakers use one of the

COURT REPORTERS AND TRANSCRIBERS 1323 RHODE ISLAND AVE., N.W. WASHINGTON, D.C. 20005-3701

(202) 234-4433

5 1 microphones, identify themselves and speak with 2 sufficient clarity and volume so that they can be 3 readily heard. 4 Since we have no further comments 5 regarding the agenda or items of interest, we'll move right away to the first item on the agenda here, which 6 7 is the Draft final revision to Regulatory Guide 1.168. Mr. Sieber? 8 MR. SIEBER: 9 Thank you, Mr. Chairman. Ι would point out that our Committee declined to review 10 11 this standard when it was issued for public comments, 12 and so the review that we're doing today is a review prior to final issuance of the standard for use. 13 The 14 Office of Nuclear Regulatory Research developed this 15 standard, and the time that it under at was development it was known as Draft Guide 1123, and it 16 was designed to replace the current version of Reg 17 Guide 1.168, which was issued in 1997. 18 And the reason why it is being revised and 19 20 reissued is because the underlying standards which are 21 IEEE 1012 and 1028, have recently been revised 22 themselves. So it is the Agency's duty then to review 23 new standard and to the extent that the it's 24 applicable to either endorse it in total or endorse it 25 with some exceptions. And so we're in the process of

> NEAL R. GROSS COURT REPORTERS AND TRANSCRIBERS 1323 RHODE ISLAND AVE., N.W. WASHINGTON, D.C. 20005-3701

(202) 234-4433

	6
1	doing that.
2	Now, this Reg Guide 1.168 is one of seven
3	reg guides that apply to digital systems in nuclear
4	power plants, and the first one is 152, which is the
5	criteria, 168, which is the one we're reviewing today,
6	which is verification, validation, reviews and audits,
7	and 169 to 173 also provide further structure in the
8	development of computer software. So this is just one
9	of a series.
10	The revision of the IEEE standard was not
11	all that expensive, but it differs in a number of ways
12	from the previous standard, and I'm sure that our
13	presenters will let you know what those differences
14	are. So without belaboring or stealing away any more
15	of the presenters' material, I will introduce Mike
16	Mayfield. He is overall responsible for this task and
17	Steve Arndt and Roman Shaffer. Mike?
18	MR. MAYFIELD: Thank you. I have with me
19	this morning Michelle Evans, the Chief of the
20	Engineering Research Applications Branch. Roman
21	Shaffer and Steve Arndt are members of her Branch that
22	have responsibility for these activities. We are here
23	today to seek Committee endorsement and I guess that's
24	a nice way of saying we would like to get a letter
25	endorsing staff publishing this update to the Reg

NEAL R. GROSS COURT REPORTERS AND TRANSCRIBERS 1323 RHODE ISLAND AVE., N.W. WASHINGTON, D.C. 20005-3701

(202) 234-4433

	7
1	Guide.
2	And with that, I would introduce Roman.
3	Roman's been with us several years, came to us out of
4	graduate school, has kind of a varied background, and
5	he took over this activity. We've had some turnover
6	in staff, Roman took it over fairly late. We've asked
7	Steve to join him this morning to deal with any
8	questions you may have. Roman's one of our hard
9	chargers, and we're looking forward to great things,
10	so please feel free to abuse him this morning. Thank
11	you. Roman?
12	DR. POWERS: How dare you?
13	(Laughter.)
14	MR. SIEBER: You won't abuse him because
15	I've been doing it for the last few weeks.
16	MR. SHAFFER: Good morning. As Mike said,
17	I'm Roman Shaffer and I've been with the NRC since
18	June of 2000. I've recently taken over the project.
19	I'm sure you all know Steven Arndt, Dr. Steven Arndt.
20	He's here to help me, and I appreciate his attendance
21	here.
22	We're here before the Committee to obtain
23	a letter of endorsement to issue the final draft of
24	Regulatory Guide 1.168 Revision 1. It's a long title,
25	but essentially it covers two IEEE standard current

COURT REPORTERS AND TRANSCRIBERS 1323 RHODE ISLAND AVE., N.W. WASHINGTON, D.C. 20005-3701

(202) 234-4433

IEEE standards. I'll get into those a little bit later, but first I'd like to move to the second slide, the overview of what will be presented here this morning.

5 I'll give a little background information, try to define a little verification and validation 6 7 exactly and provide an opening statement of some sort. Then we'll move on to the current guidance contained 8 in Regulatory Guide 1.168 Revision 0. Revisions to 9 this current quidance contained in Regulatory Guide 10 11 1.168 Revision 1. Resolution of the public comments 12 we received on the draft quide and regulatory positions in the final draft guide to Revision 1. 13 Ιf 14 you can't hear me or if I'm speaking too quickly, 15 please let me know.

The Commission has requirements regarding 16 quality and reliability of safety systems at nuclear 17 These criteria are contained in 18 power plants. 19 Appendices A and B in 10 CFR Part 50. Software 20 engineering practices rely in part on software 21 verification and validation activities as well as 22 reviews and audits to meet these requirements. NRC 23 staff endorses consensus standards, such as IEEE 24 standards, as acceptable methods for meeting these 25 criteria.

(202) 234-4433

(202) 234-4433

8

	9
1	Because sulfur V&V activities and reviews
2	and audits are important to meeting the Commission's
3	criteria, we've treated these two standards at the
4	same time in this regulatory guide. In the current
5	guide, in Revision 0 of Regulatory Guide 1.168, this
6	current guidance was issued in September of 1997. It
7	endorses two standards, IEEE Standard 1012-1986 and
8	IEEE Standard 1028-1988.
9	DR. WALLIS: Why did it take so long? Are
10	those the years, 1988?
11	MR. SHAFFER: Yes.
12	MR. SIEBER: Those are the old standards.
13	MR. SHAFFER: Those are the older
14	standards.
15	MR. SIEBER: That's the old version, and
16	now there's
17	DR. POWERS: There's a new version coming
18	up.
19	MR. SIEBER: The new version is here.
20	DR. POWERS: We're going to get to that.
21	MR. SHAFFER: In Revision 1 to the current
22	guidance, we endorse the current standards, current
23	versions of these standards. We undertook this work
24	to revise current guidance contained in Regulatory
25	Guide 1.168 in response to using nuclear reactor

COURT REPORTERS AND TRANSCRIBERS 1323 RHODE ISLAND AVE., N.W. WASHINGTON, D.C. 20005-3701

(202) 234-4433

regulation. This revision to the current guidance endorses two IEEE standards with exceptions, 1012-1998 and 1028-1997.

4 The main discussion this morning will be 5 on the revisions -- the update to 1012-1986 because the current standard -- version of this standard was 6 7 a significant rewrite in that it became a process standard and the provisions in the 1986 version were 8 9 incorporated as one component in the 1998 version of The update to 1028 was mostly in 10 IEEE Standard 1012. 11 clarifying and using them consistently terms 12 throughout the standard, and that standard, 1028-1997, gives criteria for performing adequate reviews, 13 14 inspections, audits, walk-throughs, not so much how to 15 these reviews or inspections enter or how to disposition the findings; it's just how to do a good 16 review or audit, walk-through, et cetera. So, again, 17 the main part of the discussion will cover 1012-1998 18 19 and regulatory positions -- the exceptions to this 20 standard.

21 MR. LEITCH: Roman, does this standard 22 address V&V with the -- in the manufacturing segment 23 or the user or the regulatory or all of the above? 24 MR. SIEBER: Just software. 25 MR. LEITCH: Software, yes, right, but is

> NEAL R. GROSS COURT REPORTERS AND TRANSCRIBERS 1323 RHODE ISLAND AVE., N.W. WASHINGTON, D.C. 20005-3701

(202) 234-4433

1

2

3

	11
1	it directed my question is really is it directed
2	towards the developer of the software or the user or
3	the regulator or is it applicable to all of the above?
4	MR. SHAFFER: Yes.
5	MR. SIEBER: All.
6	MR. LEITCH: All of the above.
7	MR. ARNDT: This is Steve Arndt. It's a
8	very comprehensive, broad standard. It was designed
9	by IEEE to be all-encompassing for all kinds of
10	different kind of software and all the different parts
11	of the development process. The early part where
12	you're actually defining the software, developing it,
13	writing it, the implementation, the QA of incoming
14	software, reuse, updating, all the different aspects.
15	And it's also defined for a broad segment of the
16	software population, which is why we have some
17	exceptions because we're interested in using it in the
18	nuclear area where we have some different
19	applications.
20	DR. RANSOM: Does the NRC apply this to
21	their own software?
22	MR. ARNDT: Funny you ask that. In the
23	last couple of years, there's been some issues with
24	the QA and quality associated with our internal
25	software and the software we have contracted right for

NEAL R. GROSS COURT REPORTERS AND TRANSCRIBERS 1323 RHODE ISLAND AVE., N.W. WASHINGTON, D.C. 20005-3701

(202) 234-4433

	12
1	us. So we've reviewed in several cases what kind of
2	software QA and software validation and verification
3	we should be using. In several cases, we have
4	formally adopted this standard, the '98 version, as
5	our standard with some exceptions and some
6	modifications. In some cases, we're still discussing
7	that. You'll hear next week about the sapphire code
8	peer review, and that was one that we have decided to
9	use this standard. As I said, there are some others
10	that are undergoing discussion as to whether or not we
11	should use this standard.
12	DR. WALLIS: And this covers all software?
13	MR. SIEBER: Safety-related software.
14	MR. ARNDT: This reg guide deals with
15	safety-related INC software. The standard
16	DR. WALLIS: That's very different from,
17	say, reviewing a thermohydraulic code software.
18	MR. ARNDT: Yes. Yes, it is.
19	DR. WALLIS: And I don't think your intent
20	is to apply this to thermohydraulic codes.
21	MR. ARNDT: The intent is not to apply the
22	reg guide. The standard was written to be a broad
23	standard with a lot of different
24	DR. WALLIS: But what it's interested in
25	is whether or not the software is true to the intent.

NEAL R. GROSS COURT REPORTERS AND TRANSCRIBERS 1323 RHODE ISLAND AVE., N.W. WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

	13
1	MR. ARNDT: That's correct.
2	DR. WALLIS: That's not to say that the
3	function performed by the code itself is verified in
4	any way. It's that if you put in an equation that the
5	software truly represents that equation, it's not that
6	the equation is a good one, right?
7	MR. ARNDT: The concept of verification
8	and validation basically gets to that distinction.
9	Verification is verifying that you wrote what you
10	thought you wrote. You didn't write bugs into it.
11	Validation goes to is it doing what the requirement
12	said, to model things
13	DR. WALLIS: Oh, that's very different.
14	That's a huge task.
15	MR. ARNDT: It is a much more difficult
16	task, and this has guidance on that.
17	CHAIRMAN BONACA: It includes comparison
18	to
19	MR. ARNDT: It includes how do you know
20	what you wrote is proper, how did the requirements get
21	put together and things like that.
22	DR. WALLIS: How does it compare with data
23	and that sort of thing?
24	MR. ARNDT: Right. How does it compare
25	with benchmarks, a number of things.

COURT REPORTERS AND TRANSCRIBERS 1323 RHODE ISLAND AVE., N.W. WASHINGTON, D.C. 20005-3701

(202) 234-4433

	14
1	DR. WALLIS: That's a huge task.
2	MR. ARNDT: Yes. And this particular reg
3	guide is dealing with a much, much smaller subset of
4	that. It has to do with the actual safety system
5	software.
6	DR. WALLIS: Well, if they could tell us
7	how to validate thermohydraulic codes, that would be
8	a real coup.
9	MR. ARNDT: That's why the implementation
10	of a standard is not a trivial thing in things like a
11	code or a thermohydraulic codes and things like that.
12	But to answer Dr. Ransom's question, we are looking at
13	it for in-house codes like that.
14	MR. MAYFIELD: This is Mike Mayfield.
15	Steve, you may want to mention this international
16	conference that's coming up.
17	MR. ARNDT: Yes, actually, thank you. One
18	of the things that we're also doing from an NRC
19	standpoint is looking at how these kinds of issues, as
20	Dr. Wallis pointed out, is doable, what are the
21	issues, what are the comparisons between things like
22	real-time safety software and thermohydraulic codes
23	and things like that. We're going to be having an
24	NEA-sponsored workshop next summer, most likely in
25	August, I don't think we've come to closure on the

COURT REPORTERS AND TRANSCRIBERS 1323 RHODE ISLAND AVE., N.W. WASHINGTON, D.C. 20005-3701

(202) 234-4433

	15
1	dates, but I think it's going to be the second week of
2	August of next year. It's going to be an
3	international workshop on this specific issue: What
4	are the techniques, what are the tools, what can we
5	learn from this kind of work to apply to
6	thermohydraulic codes
7	DR. WALLIS: And the two on this are
8	independent, because during the course of an accident
9	if the code runs fast enough, you may want to run the
10	thermohydraulic code in order to decide what decisions
11	to make about where to come to some state at the
12	plant.
13	MR. ARNDT: That has actually been
14	discussed, particularly in Japan. They've been
15	working on a program very similar to that.
16	DR. WALLIS: They're tied together.
17	MR. ARNDT: Yes. Did we beat that to
18	death?
19	MR. SIEBER: Well, I think just to amplify
20	Dr. Wallis' comments and questions a little bit, this
21	standard actually does get to the phenomeninological
22	modeling.
23	MR. ARNDT: It does.
24	MR. SIEBER: And it provides documentation
25	so that you can follow what's going on in the coding

COURT REPORTERS AND TRANSCRIBERS 1323 RHODE ISLAND AVE., N.W. WASHINGTON, D.C. 20005-3701

(202) 234-4433

1 process, and I think that that is a leap forward as 2 far as thermohydraulic codes are concerned. On the 3 other hand, the application of this reg guide goes 4 more to digital computers used as protection devices 5 in power plants. Do we trip the reactor, and there's not so much of this phenominological modeling that 6 7 goes on in those kinds of codes. 8 MR. ARNDT: That's correct. But the extension to other 9 MR. SIEBER: 10 codes is -- it would make for an awful lot of paper but when you were all done I think you could have 11 12 great faith in the product. MR. SHAFFER: The Standards Committee that 13 14 developed the standard was fairly broad. The members 15 on the Standards Committee were fairly broad from the number of industries besides nuclear, such as medical 16 17 and aerospace, so the regulatory positions taken in this revision to the current quidance have to do with 18 19 taking exceptions to the standard to apply it to our 20 systems, as mentioned. 21 The next slide move to the public comments 22 and their resolution. The comment period on the draft guide was from March 5, 2003 to April 11, 2003. 23 Two 24 external stakeholders provides comments: South 25 Carolina Electric and Gas Company and Progress Energy.

> NEAL R. GROSS COURT REPORTERS AND TRANSCRIBERS 1323 RHODE ISLAND AVE., N.W. WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

16

	17
1	There were a total of four comment items, but there
2	are only two really groupings. There's not very many
3	comments, meaning it doesn't make sense to group them
4	but that's the simplest way to handle them. These
5	comments did speak to improved clarity.
6	MR. SIEBER: Those comments and their
7	analysis and resolution is in Tab 16 of your books.
8	MR. SHAFFER: Both commenters, SCE&G and
9	Progress, commented on the independence requirements
10	in IEEE Standard 1012-1998. The concern was that
11	staff was endorsing a potentially endorsing a level
12	of control in excess of that in Appendix B. And
13	Progress went further and said it may be broadly
14	interpreted as a questioning existing organizational
15	structure and independence. Our resolution was to
16	agree with these comments and revise the draft guide
17	accordingly. Next slide.
18	CHAIRMAN BONACA: So this means that they
19	feel that the independence requirements in IEEE
20	standards exceed the Appendix B requirements.
21	MR. ARNDT: Yes. The primary issue was
22	having an independent organization do the V&V as
23	opposed to a different part of one organization.
24	CHAIRMAN BONACA: I see what you mean.
25	MR. ARNDT: And that was beyond what we

NEAL R. GROSS COURT REPORTERS AND TRANSCRIBERS 1323 RHODE ISLAND AVE., N.W. WASHINGTON, D.C. 20005-3701

(202) 234-4433

1traditionally require in Appendix B.2MR. SHAFFER: Yes. The standard talks3about three forms of independence: Managerial,4technical and financial independence. And NRC staff5in the draft guide recommended that these three forms6of independence be achieved as well as the separate7organization.8DR. WALLIS: I don't quite understand9this. This is making sure that the review is done by10people who are independent of the main organization in11some way?12MR. ARNDT: That's correct. And depending13upon your interpretation of the standard, that would14require someone actually in a different organization1516DR. WALLIS: Yes. You'd have to hire17someone from outside your plant.18MR. ARNDT: Right. Right. And then19that's beyond the current requirements within Appendix20B.21MR. SIEBER: In fact, the early software22that we wrote we did hire an outside contractor to do23the V&V function, but it was opposed to the standard24practice of engineering assurance where you had a25branch within your own engineering department that did		18
3about three forms of independence: Managerial, technical and financial independence. And NRC staff5in the draft guide recommended that these three forms of independence be achieved as well as the separate organization.7DR. WALLIS: I don't quite understand this. This is making sure that the review is done by people who are independent of the main organization in some way?12MR. ARNDT: That's correct. And depending upon your interpretation of the standard, that would require someone actually in a different organization is omeone from outside your plant.18MR. ARNDT: Right. Right. And then that's beyond the current requirements within Appendix B.21MR. 	19
1	the reviews, which was allowed by Appendix B. And so
2	we wanted to make the computer software V&V function
3	in the same kind of an organizational setting as you
4	do regular engineering assurances.
5	CHAIRMAN BONACA: It is just a surprise
6	that a requirement would exist for 1012. I mean this
7	is regarding software verification and validation. I
8	mean this means a level of understanding of the
9	software that I believe only the people that developed
10	it would have.
11	MR. ARNDT: That has been an open issue in
12	the software business for quite some time. What are
13	the qualifications of people performing V&V, not only
14	their independence from the organization but also
15	their knowledge of the type of software and the
16	specific software. And that's even though it was
17	incorporated in the standard the way it's stated,
18	that's still a very open issue within the technical
19	community. And because of the issue you bring up,
20	there's a tradeoff between not having been involved
21	with it and having a fresh eye and not having
22	financial issues and things like that versus how well
23	do you know it, how do you do it, and that's a very
24	difficult balance to make. And, of course, we have
25	the added issue of the previous guidance to deal with.

COURT REPORTERS AND TRANSCRIBERS 1323 RHODE ISLAND AVE., N.W. WASHINGTON, D.C. 20005-3701

(202) 234-4433

	20
1	DR. WALLIS: Well, there's the question of
2	accountability. I mean if a licensee does it himself,
3	then he's accountable, but if he hires someone
4	outside, then he has to do it himself anyway to be
5	accountable
6	MR. ARNDT: Exactly.
7	DR. WALLIS: so it doubles the work.
8	CHAIRMAN BONACA: And there are all kinds
9	of issues there. I mean in some cases this may be
10	proprietary software and who are you going to hire to
11	do the verification and validation? I can see the
12	concern.
13	MR. SHAFFER: Another comment from
14	Progress was regarding the software grading process
15	defined in 1012-1998. The nuclear industry uses a
16	different approach to software quality than the one
17	defined in 1012-1998. We use a the nuclear
18	industry uses a two-tiered grading system: Safety and
19	non-safety. The one defined in the standard is a four
20	software integrity level one through four, four
21	being the highest. Progress recommended that all
22	safety system software at nuclear power plants be
23	assigned safety software integrity level four, and we
24	agreed with that and incorporated their
25	recommendation.

COURT REPORTERS AND TRANSCRIBERS 1323 RHODE ISLAND AVE., N.W. WASHINGTON, D.C. 20005-3701

(202) 234-4433

	21
1	DR. WALLIS: So there's nobody else who's
2	protesting that?
3	MR. STEIN: No.
4	DR. WALLIS: One comment is suggesting it.
5	No sign that other people would not approve of this?
6	MR. SHAFFER: Not to my knowledge.
7	MR. ARNDT: The real issue is the and
8	that's one of the things that changed between the old
9	standard and the new standard was to assign, in
10	essence, an importance measure to software based on
11	its criticality. And what is defined in the new
12	standard is software integrity level, and they're
13	based on things like if it fails, what are the
14	consequences, what are the time frames and things like
15	that. And it was originally in the standards were put
16	together for this use in airplanes and things like
17	that where if a computer program for routing the
18	planes failed, it would not be as big a deal as if the
19	flight
20	MR. SIEBER: Hit the ground.
21	MR. ARNDT: computer failed and things
22	like that. If you look at the definitions of the
23	various skill levels, in all likelihood real-time
24	safety systems would fall into category four anyway,
25	because it's basically things that if it fails, the

COURT REPORTERS AND TRANSCRIBERS 1323 RHODE ISLAND AVE., N.W. WASHINGTON, D.C. 20005-3701

(202) 234-4433

1 consequence is immediate, and if it fails, the 2 consequence has potentially severe aspects. The issue 3 when we put out the draft was the concept of if you 4 have a safety system that doesn't have those aspects, 5 you could try and quantify it as a three or a two. The comment back was that, "That's not the way we're 6 7 set up. We've got a QA program for safety systems and 8 we have a QA program for everything else, and it doesn't make sense to add that evaluation to it, " and 9 10 of course the licensee is free so that this is just a preferred method to come back and say, "We would 11 12 prefer to do it some other way," or they could come back under 5069, I think it is, the graded QA process, 13 14 and also do it this way. So we don't preclude them 15 from doing that, and we don't have any reason to 16 believe anyone would want to do it a priori. In our 17 graded QA applications, no one has come to us and said they wanted to do this for other reasons anyway. 18 Did 19 I answer your question? Okay.

20 MR. SHAFFER: Next slide. We're moving to 21 the regulatory positions need, revision to the current 22 guidance. First regulatory position is on critical 23 software. Again, as we just discussed, safety system 24 software in nuclear power plants should be assigned 25 software integrity level four.

> NEAL R. GROSS COURT REPORTERS AND TRANSCRIBERS 1323 RHODE ISLAND AVE., N.W. WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

2.2

1 Second regulatory position is on software 2 reliability and this reaffirms staff's position 3 regarding quantitative reliability goals. We don't 4 accept that as а sole means of meeting the When it comes to those 5 Commission's requirements. systems, we like the hardware and software taken 6 7 together to show some sort of indicator of -- provide assurance that the system meets the Commission's 8 9 requirements. Next slide.

10 Next regulatory position is on 11 independence and software verification and validation. 12 Again, we talked about this earlier. This was the subject of one of the comments. There is guidance or 13 1012-1998, 14 requirements in the standard, on 15 managerial, technical and financial independence, and we consider these to meet the requirements in Appendix 16 17 B, but this does not mean that they need someone outside their organization to perform software 18 verification and validation. 19

20 Conformance of materials --21 CHAIRMAN BONACA: How do you clarify this 22 interpretation, I mean in the Reg Guide? 23 MR. ARNDT: Yes, in the Reg Guide. The 24 structure is background, the statement that we endorse 25 the standard is a means to meet the requirement, and

> NEAL R. GROSS COURT REPORTERS AND TRANSCRIBERS 1323 RHODE ISLAND AVE., N.W. WASHINGTON, D.C. 20005-3701

(202) 234-4433

24 1 then the exceptions are written through the regulatory 2 positions. MR. SHAFFER: Conformance of materials is 3 4 the next regulatory position, and this provides 5 quidance on retrospective V&V of software not verified. That is reusable software. 6 7 Quality assurance is another regulatory position in that the standard -- there need to be 8 additions to the provisions in IEEE Standard 1012-1998 9 in order to satisfy the criterion in Appendix B. 10 We don't specify what those are, it's just additions need 11 12 to be made. Tools for software development is the next 13 14 regulatory position, and this ensures that the tools 15 used to develop the safety system software don't introduce errors or faults, and if they do, that the 16 If this can't be test methods will catch those. 17 demonstrated, then this regulatory guide -- the 18 19 provisions in this regulatory guide will apply. Regulatory Position 7 is verification and 20 21 validation tasks. There are certain optional tasks or 22 in the Standard 1012-1998 there are tasks identified 23 as optional in the software V&V process. The staff 24 position is some of these optional tasks are in fact 25 part of a minimum set of activities for safety system

> NEAL R. GROSS COURT REPORTERS AND TRANSCRIBERS 1323 RHODE ISLAND AVE., N.W. WASHINGTON, D.C. 20005-3701

(202) 234-4433

	25
1	software, and they are given there: Audits,
2	regression analysis, testing security systems, test
3	evaluation and evaluation of user documentation. In
4	Annex G to IEEE Standard 1012-1998, these are
5	described in further detail.
6	DR. WALLIS: So the sort of thing you're
7	verifying is that there aren't sort of typographical
8	errors in a code. You're not verifying the robustness
9	of the software in an environment where there might be
10	random inputs that might disturb the software in some
11	way?
12	MR. ARNDT: The verification is that the
13	code operates correctly
14	DR. WALLIS: Right.
15	MR. ARNDT: based on
16	DR. WALLIS: Just like proofreading a
17	manuscript really.
18	MR. ARNDT: Yes, in somewhat more
19	complicated ways, because you can't go down every path
20	in a software code, although these are much, much
21	simpler than what you would think of in a
22	computational code. So you do things like software
23	audits, regression testing, things like that.
24	DR. WALLIS: It doesn't get hung up in
25	some loop somewhere.

COURT REPORTERS AND TRANSCRIBERS 1323 RHODE ISLAND AVE., N.W. WASHINGTON, D.C. 20005-3701

(202) 234-4433

1 MR. ARNDT: Right, things like that. The 2 validation part of it gets to things like test like that. 3 evaluation and things You try and 4 determine whether or not your tests are really testing 5 the function of the system and things like that. And part of that is is there an opportunity for something 6 7 like a random failure or things like that to bring down the system? There's always going to be failures, 8 9 which goes to the reliability issue, but this is to validate that what you did is what you wanted to do. 10 11 MR. LEITCH: So these regulatory positions in some cases exceptions to the standard or 12 are amplification to the standard? 13 14 MR. ARNDT: They are exceptions to the 15 They're saying if you do everything in the standard. standard, you're going to be okay except in some cases 16 you don't have to do as much, like the independence; 17 in some cases you need to do more, like this one. 18 19 MR. LEITCH: Okay. 20 MR. ARNDT: So just think of it as here's 21 the standard, that's everything you need to do. Take 22 these pieces out, stick these pieces in, and you're 23 set. 24 MR. LEITCH: Now, are these seven, I think 25 you've referred to here, are they all they are or you

> NEAL R. GROSS COURT REPORTERS AND TRANSCRIBERS 1323 RHODE ISLAND AVE., N.W. WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

26

	27
1	just telling us seven of the more important ones?
2	MR. SHAFFER: There's an eighth regulatory
3	position on other codes and standards, and in that
4	we use that in other regulatory guides. It just says
5	if the endorsed standard references other standards,
6	you need to take those one by one.
7	MR. LEITCH: So that's kind of an
8	administrative
9	MR. SHAFFER: Right. In conclusion,
10	regulatory guide final, Draft Regulatory Guide 1.168
11	Revision 1 endorses current IEEE standards, IEEE
12	Standard 1012-1998, IEEE Standard 1028-1997. The
13	regulatory positions, which are exceptions to the
14	standards, are consistent with the Commission's
15	requirements and also with Standard Review Plan
16	Chapter 7. There's no backfit issues. Our regulatory
17	analysis show there's no backfit issues and whatever
18	endorsement
19	DR. WALLIS: So in terms of enforcement,
20	you'd simply check that the licensee has gone through
21	the process properly.
22	MR. SHAFFER: That's correct.
23	DR. WALLIS: You wouldn't dig any deeper
24	than that, presumably. If they say they're following
25	the standard, you believe it.

COURT REPORTERS AND TRANSCRIBERS 1323 RHODE ISLAND AVE., N.W. WASHINGTON, D.C. 20005-3701

(202) 234-4433

	28
1	MR. ARNDT: Well, you really need to talk
2	to NRR about enforcement issues, but the review is
3	that they have done what they said they were going to
4	do. And then if you want to go out and look at
5	inspections, then you look at whether or not how
6	they've done what they do.
7	CHAIRMAN BONACA: Could you give me a
8	sense of what are the substantive changes of the IEEE
9	standards that are being referred to Rev 1, referred
10	to Rev 0?
11	MR. ARNDT: The biggest difference, as I
12	think we've talked about earlier, is that well,
13	biggest two differences in 1012 is that 1012 is a much
14	more comprehensive document than it used to be. The
15	older version was basically just a procedure for doing
16	a V&V. The new one is much more detailed, how do you
17	figure out what you're going to do, what kinds of
18	issues you're going to have and things like that. It

18 issues you're going to have and things like that. It 19 also introduced the software integrity level concept, 20 the four graded systems, and maps very detailed, we've 21 got whole sets of charts like that, that basically 22 talks about if you have this kind of software and this 23 kind of part of its development, these are the kinds 24 of things you need for software integrity level four, 25 five, three. So those are the two major differences,

> NEAL R. GROSS COURT REPORTERS AND TRANSCRIBERS 1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

	29
1	as Roman pointed out earlier.
2	And the other standard is mostly
3	clarification and cleaning up language, making sure
4	it's self-consistent and things like that. As we've
5	mentioned, we've determined that we're going not take
6	advantage of the skill levels as such; however, the
7	standard now has a lot more information about what it
8	is you need to do for a skill level four than it
9	previously had. Did I miss anything.
10	MR. ROSEN: Over the years, EPRI has been
11	very active in the area of validation and verification
12	of software. What has been their role, if any, in
13	this process, or did you get any comments from EPRI?
14	MR. ARNDT: We did not. We have discussed
15	this as well as other parts of the standard review
16	plan with EPRI on a relatively frequent basis. And I
17	actually was out at EPRI this summer, I think it was
18	August, talking about software issues, and they did
19	not raise this as an issue they wanted to weigh in on.
20	MR. MAYFIELD: Mr. Chairman, that
21	concludes the staff's presentation unless the
22	Committee has other questions. Again, we are
23	requesting a letter to move forward on this. Thank
24	you.
25	MR. SIEBER: Okay. If there are no other

1	questions, any member have a question they'd like to
2	ask? I have these standards here and all the
3	documentation if anybody would like to look at them.
4	And if there are no questions, Mr. Chairman, I turn it
5	back to you.
6	DR. RANSOM: I have a small one. The
7	standard governing coding standards in the software,
8	does it get into that level of detail?
9	MR. SIEBER: You mean like how closely do
10	you adhere to Fortran 4?
11	DR. RANSOM: Right, that kind of thing or
12	
13	MR. ARNDT: No, it does not get into that
14	level of detail.
15	DR. RANSOM: The testing, does it get
16	involved with looking for things like dead code,
17	conflicts?
18	MR. ARNDT: It talks about generic kinds
19	of testing that you need to do. If you look at
20	software testing metrics and things like that, the
21	concept of looking at requirements testing versus
22	coding testing versus regression testing and things
23	like that, it will get down to that level of detail,
24	but it won't say if you have this kind of buffer
25	array, you need to do this kind of test.

1	MR. SIEBER: Any other questions. Okay,
2	Mr. Chairman.
3	CHAIRMAN BONACA: Okay. Thank you very
4	much for your presentation. I think we'll go off the
5	record now and we'll take a long break. We're ahead
б	of time and let's take a break until 20 of ten, and at
7	that time we'll hear subcommittee report on reactor
8	fuels.
9	(Whereupon, at 9:09 a.m., the ACRS open
10	session was concluded.)
