INSPECTION PROCEDURE 92719

SAFETY EVALUATION REPORT (SER) REVIEW AND FOLLOWUP

PROGRAM APPLICABILITY: 2513

92719-01 INSPECTION OBJECTIVES

To ascertain whether the applicant has satisfactorily implemented commitments found acceptable by the NRC as documented in the SER.

92719-02 INSPECTION REQUIREMENTS

02.01 Program Review.

- a. Acquire a copy of the SER and any supplements thereto.
- b. Ascertain whether the applicant has submitted any additional pertinent information following issuance of the SER or most recent SER supplement.
- c. For selected licensee commitments, ascertain whether actions were taken by the applicant as described in the SER.

92719-03 INSPECTION GUIDANCE

The SER is a summarization of the NRC safety review of the facility. It is based on information in the applicant's final safety analysis report (FSAR), as reviewed against the federal regulations, construction permits criteria, and the NRC Standard Review Plan, NUREG-0800 (formerly issued as NUREG-75/087). The outstanding matters described in the SER must be favorably resolved before an operating license may be issued. Some SER matters will require inspection followup outside normal inspection activities. These matters may be identified in the SER and/or identified to the inspector by licensing staff. The inspection requirements in Section 02.03 apply to these special commitments. In addition, the inspector should select and verify the licensee's adherence to several commitments referred to in the SER.
